28 const double EPS = DBL_EPSILON;
29 void printVector( auto& v ){ fori(i,0,sz(v)) cout <<
    v[i] << " "; cout << endl; }
30 void fastIO() { ios_base::sync_with_stdio(0); cin.
    tie(0); cout.tie(0); }

```

Listing 1: Racso's template.

## 2 C++ Sintaxis

### 2.1 Compilation sentences

To compile and execute in C++:

```

g++-13 -Wall -o solucion.exe solucion.cpp
g++ -std=c++20 -Wall -o main a.cpp ./solucion.exe < input.txt > output.txt

```

To compile and execute in Java:

```

javac -Xlint Solucion.java
java Solucion < input.txt > output.txt

```

To execute in Python (two options):

```

python3 solucion.py < input.txt > output.txt
ppyy3 solucion.py < input.txt > output.txt

```

### 2.2 Custom comparators

```

1 // Using function
2 bool cmpFunction(const pair<int,int> &a, const pair<
    int,int> &b) {
3     return a.second < b.second;

```

```
4 }
5 sort(all(v), cmpFunction);
6 // Using functor
7 struct CmpFunctor {
8     bool operator()(const pair<int,int> &a, const pair
9         <int,int> &b) const {
10         return a.second < b.second;
11     }
12 };
13 sort(all(v), CmpFunctor());
14 // Using lambda function
15 sort(all(v), [](const pair<int,int> &a, const pair<
16     int,int> &b) {
17     return a.second < b.second;
18 });
```

Listing 2: Template for custom sorting, using as example ordering a vii ascending by second element.

## 2.3 \*STL DS Usage

## 2.4 \*Strings methods

## 2.5 \*Pragmas

## 2.6 Bit Manipulation Cheat Sheet

### Bitwise operators:

- & (AND): Sets each bit to 1 if both bits are 1.
- | (OR): Sets each bit to 1 if at least one bit is 1.
- ^ (XOR): Sets each bit to 1 if bits are different.
- ~ (NOT): Inverts all bits.
- << (Left shift): Shifts bits left, fills with 0.

- >> (Right shift): Shifts bits right.
- Get LSB:  $n \& -n$

**Basic Bit Tasks:**

- Get bit:  $(n \& (1 \ll i)) \neq 0$
- Set bit:  $n \mid (1 \ll i)$
- Clear bit:  $n \& \sim(1 \ll i)$
- Toggle bit:  $n \hat{=} (1 \ll i)$
- Clear LSB:  $n \& (n - 1)$

**Set Operations:**

- Subset check:  $(A \& B) == B$
- Set union:  $A \mid B$
- Set intersection:  $A \& B$
- Set difference:  $A \& \sim B$
- Toggle subset:  $A \hat{=} B$

Gray code:  $G = B \oplus (B \gg 1)$

## 2.7 Comparing Floats

```
1 long double a, b, EPS = 1e-9;
2 if( abs(a - b) < EPS ) {
3     // 'a' equals 'b'
4 }
```

Listing 3: Check if two real numbers are equal using an epsilon scope.

## 2.8 Ceil

$$\left\lceil \frac{a}{b} \right\rceil = \frac{a + b - 1}{b}$$

(Originally I thought  $\left\lceil \frac{a}{b} \right\rceil = \frac{a-1}{b} + 1$ , but this calculates the wrong way in the cases where  $a = 0$ )

```
1 int myCeil(long long a, long long b) {
2     return (a + b - 1)/b;
3 }
```

Listing 4: A way to do ceil operation between integers without making explicit conversions.  $a$  and  $b$  are `int`, but the operation  $a+b-1$  can cause an overflow, so they must be casted into `long long` to avoid this. The result must be `int` anyway.

## 3 Miscellaneous

### 3.1 Binary Search

```
1 int binary_search( vector<int>& list, int n, int
   target ) {
2     int x0 = 0, x1 = n-1, mid;
3     while( x0 <= x1 ) {
4         mid = (x0 + x1) / 2; // (x1 - x0) / 2 + x0;
5         if( list[mid] == target )
6             return mid;
7         list[mid] < target ? x0 = mid + 1 : x1 = mid
   - 1;
8     }
9     return -1;
10 }
```

Listing 5: Classic (Vanilla) implementation of Binary Search. Returns the index where `target` was found. Binary Search works on  $O(\log_2(n))$ , let  $n$  be the size of the container.

```
1 int binary_search( vector<int>& list, int n, int
   target ) {
2     int ans = 0;
```

```

3     function<bool(int)> check = [&](int idx)->bool {
4         return idx < n && list[idx] <= target;
5     };
6     for( int i = 31; i >= 0; i-- ) {
7         if( check( ans + (1 << i) ) )
8             ans += 1 << i;
9     }
10    return list[ans] == target ? ans : -1;
11 }

```

Listing 6: Logarithmic jumps implementation of Binary Search. Returns the index where `target` was found. Binary Search works on  $O(\log_2(n))$ , let  $n$  be the size of the container.

```

1 int binary_search( vector<int>& list, int n, int
   target ) {
2     int left = 1, right = n + 1, mid;
3     while(right - left >= 1) {
4         mid = left + (right - left) / 2;
5         if( list[mid] >= target && target > list[mid -
6             1]) {
7             //----- TODO logic here -----//
8             break;
9         }
10        else
11            if( list[mid] < target )
12                left = mid + 1;
13        else
14            right = mid;

```

```

14     }
15 }

```

Listing 7: Binary Search implementation for searching an element in the interval  $(numbers_{i-1}, numbers_i]$ . Originally used on Codeforces problem 474 - B (Worms). Returns the index where `target` was found. Binary Search works on  $O(\log_2(n))$ , let  $n$  be the size of the container.

```

1 function<bool(ll)> check = [&](ll t) -> bool {
2     ll products = 0;
3     for(ll machine : v) {
4         products += t / machine;
5         if( products >= target )
6             return true;
7     }
8     return products >= target;
9 };
10 for(int i = 0; i < 70; i++) {
11     mid = (x0 + x1) / 2;
12     check(mid) ? x1 = mid : x0 = mid + 1;
13 }

```

Listing 8: Implementation of Binary Search in the Answer. Originally used on CSES problem *Factory Machines*. Binary Search works on  $O(\log_2(n))$ , let  $n$  be the size of the container.

### 3.1.1 \*Parallel Binary Search

### 3.1.2 \*Ternary Search

## 3.2 Kadane's Algorithm

```

1 ll arns = v[0], maxSum = 0;
2 for(i,0,n)
3 {
4     maxSum += v[i];
5     arns = max(arns, maxSum);
6     maxSum = max(0LL, maxSum);
7 }

```

Listing 9: Uses Kadane's Algorithm to find maximum subarray sum in  $O(n)$ .

## 4 Queries

### 4.1 Prefix Sum 2D

```

1 for(int i = 1; i <= n; i++)
2     for(int j = 1; j <= n; j++)
3     {
4         prefix[i][j] = prefix[i][j-1] + prefix[i-1][j] -
5         prefix[i-1][j-1];
6         prefix[i][j] += forest[i-1][j-1] == '*' ? 1 : 0;
7     }
8 for(int i = 0; i < q; i++)
9 {
10     pair<int,int> p1, p2;
11     cin >> p1.fi >> p1.se >> p2.fi >> p2.se;
12     int arns = prefix[p2.fi][p2.se];
13     arns -= prefix[p2.fi][p1.se-1] + prefix[p1.fi-1][p2.se];
14     arns += prefix[p1.fi-1][p1.se-1];

```

```

14     cout << arns << endl;
15 }

```

Listing 10: Construction and query of how many 1's are there in a matrix. Originally used on *Forest Queries* from CSES.

### 4.2 \*Sparse Table

### 4.3 \*Sqrt Decomposition

### 4.4 \*Fenwick Tree

### 4.5 \*Fenwick Tree 2D

### 4.6 Segment Tree

```

1 typedef long long ll;

10 };
11 dfs(n);

```

Listing 18: DFS implementation with a lambda function implemented with a map instead of vector of vectors, and a set to track visited nodes. DFS runs in  $O(|V| + |E|)$ .

## 5.3 Shortest Path

### 5.3.1 Dijkstra's Algorithm

```

1 typedef long long ll;
2 typedef pair<ll,ll> pll;
3
4 vector<vector<ll>> graph;
5 vector<ll> visited;
6 graph.assign(n, vector<ll>() ); // <--- main
7 visited.assign(n, false); // <--- main
8
9 vector<ll> dijkstra( int n, int source, vector<
    vector<pll>> &graph ) {
10     vector<ll> dist( n, INFTY );
11     priority_queue<pll, vector<pll>, greater<pll>> pq;
12     dist[ source ] = 0;
13     pq.push( {0, source} );
14     while( ! pq.empty() ) {
15         ll d = pq.top().first;
16         ll u = pq.top().second;
17         pq.pop();
18         if( d > dist[ u ] ) continue;
19         for( auto &edge : graph[ u ] ) {

```

```

20     ll v = edge.first;
21     ll weight = edge.second;
22     if( dist[ u ] + weight < dist[ v ] ) {
23         dist[ v ] = dist[ u ] + weight;
24         pq.push( {dist[ v ], v} );
25     }
26 }
27 }
28 return dist;
29 }

```

Listing 19: Iterative implementation of Dijkstra's Algorithm for shortest path over a graph represented as a AdjacencyList on vector of vectors. Returns a vector with the shortest path to every other vertex in the graph.  $O(|E| \times \log_2(|V|))$ . doesn't work with negative weights.

```

1  vvp11 graph(n+1,vp11());
2  vector<bool> visited(n+1,false);
3  function<v11(int)> dijkstra = [&](int source) -> v11
4  {
5      v11 dist(n+1,INF);
6      priority_queue<p11,vp11,greater<p11>> pq;
7      dist[source] = 0;
8      pq.push({0,source});
9      while( ! pq.empty() ) {
10         ll d = pq.top().fi;
11         ll u = pq.top().se;
12         pq.pop();
13         if( d > dist[u] ) continue;

```

```

13     for(p11 edge : graph[u]) {
14         ll v = edge.fi;
15         ll w = edge.se;
16         if( dist[u] + w < dist[v] ) {
17             dist[v] = dist[u] + w;
18             pq.push({dist[v],v});
19         }
20     }
21 }
22 return dist;
23 };

```

Listing 20: Iterative implementation of Dijkstra's Algorithm as a Lambda Function for shortest path over a graph represented as a AdjacencyList on vector of vectors. Returns a vector with the shortest path to every other vertex in the graph.  $O(|E| \times \log_2(|V|))$ . Doesn't work with negative weights.

### 5.3.2 \*Floyd-Warshall's Algorithm

### 5.3.3 Bellman-Ford Algorithm

```

1  int V, E;
2  cin >> V >> E;
3  vvi edges(E,vi(3,0));
4
5  for(int i = 1; i <= E; i++)
6      cin >> edges[i][0] >> edges[i][1] >> edges[i][2];
7
8  function<vi(int)> bellman_ford = [&](int src) -> vi
9  {

```

```

10 vi dist(V,INF);
11 dist[src] = 0;
12 for(int i = 0; i < V; i++)
13 {
14     for( vi edge : edges )
15     {
16         int u = edge[0];
17         int v = edge[1];
18         int w = edge[2];
19         if( dist[u] != INF and dist[u] + w < dist[v]
20     )
21     {
22         if( i == V-1 )
23             return = {-1};
24         dist[v] = dist[u] + w;
25     }
26 }
27 return dist;
28 };

```

Listing 21: Finds the shortest route from a source vertex, to every other one in the graph. Works over a list of edges. Runs in  $O(|V| \times |E|)$ . Can be used to find negative cycles.

## 5.4 Minimum Spanning Tree (MST)

### 5.4.1 \*Prim's Algorithm

### 5.4.2 \*Kruskal's Algorithm

## 5.5 \*Bipartite Checking

## 5.6 \*Negative Cycles

## 5.7 Topological Sort

```

1 vi topo;
2 vvi graph(V+1,vi());
3 vector<bool> visited(V+1,false);
4 function<void(int)> dfs = [&](int u) -> void {

12        if( newI >= 0 && newI < n && newJ >= 0 && newJ <
            m && grid[newI][newJ] == 'T' )
13            return;

```

```

14     }
15     for( ii move : dirs ) {
16         newI = i + move.fi; newJ = j + move.se;
17         if( newI >= 0 && newI < n && newJ >= 0 && newJ <
            m )
18             traverse(newI, newJ);
19     }
20 };
21 fori(i,0,n)
22     cin >> grid[i];
23 fori(i,0,n) {
24     fori(j,0,m) {
25         if( grid[i][j] == 'S' ) {
26             grid[i][j] = '.';
27             start.fi = i;
28             start.se = j;
29         }
30     }
31 }
32 traverse(start.fi, start.se);
33 cout << arns << endl;

```

Listing 24: Traverse a matrix of 'n' x 'm' on grid representation. The matrix is composed of '.' for a valid space (empty), '#' for a wall, 'T' for a trap, and a number for a treasure. This implementation takes the sum of every treasure in the maze. The condition for moving to the next location is that there are no Traps nearby (up, down, left, right), so the player will never be killed while traversing. It also implements a way to read numerous test cases, but without knowing beforehand how many there are. Runs in  $O(n \cdot m)$ . Originally used on the problem *Treasures* from 2024-2025 ICPC Bolivia Pre-National Contest.

### 5.14 Lava Flow (Multi-source BFS)

```

Listing 26: Commented template for solving MaxFlow problems with Dinic's algorithm. Works in complexity  $O(|V|^2 \times |E|)$ . In bipartite graphs and graphs with unitary max capacity the complexity turns  $O(|E| \times \sqrt{|V|})$ .

**Download Speed** How does a particular flow problem looks like? Following is the statement for the problem CSES 1694 (Download Speed):

Consider a network consisting of  $n$  computers and  $m$  connections. Each connection specifies how fast a computer can send data to another computer.

Kotivalo wants to download some data from a server. What is the maximum speed he can do this, using the connections in the network?

**Input**

The first input line has two integers  $n$  and  $m$ : the number of computers and connections. The computers are numbered  $1, 2, \dots, n$ . Computer 1 is the server and computer  $n$  is Kotivalo's computer.

After this, there are  $m$  lines describing the connections. Each line has three integers  $a, b$ , and  $c$ : computer  $a$  can send data to computer  $b$  at speed  $c$ .

**Output**

Print one integer: the maximum speed Kotivalo can download data.

```

1 int main()
2 {
3     fastIO();
4
5     int n, m, u, v, w;
6
7     cin >> n >> m;
8
9     Dinic flow(n+1,1,n); // size n+1 to fix 0-

```

```

10 indexed indexes, 1 is the source (server), 'n' is
11 the sink (Kotivalo)
12
13     fori(i,0,m)
14     {
15         cin >> u >> v >> w;
16         flow.addEdge(u,v,w);
17     }
18
19     cout << flow.maxFlow() << endl;
20
21     return 0;
22 }

```

### Police Chase Max Flow-Min Cut Theorem: MaxFlow = MinCut.

Following is the statement for the problem CSES 1695 (Police Chase):

Kaaleppi has just robbed a bank and is now heading to the harbor. However, the police wants to stop him by closing some streets of the city.

What is the minimum number of streets that should be closed so that there is no route between the bank and the harbor?

#### Input

The first input line has two integers  $n$  and  $m$ : the number of crossings and streets. The crossings are numbered  $1, 2, \dots, n$ . The bank is located at crossing 1, and the harbor is located at crossing  $n$ .

After this, there are  $m$  lines that describing the streets. Each line has two integers  $a$  and  $b$ : there is a street between crossings  $a$  and  $b$ . All streets are

two-way streets, and there is at most one street between two crossings.

#### Output

First print an integer  $k$ : the minimum number of streets that should be closed. After this, print  $k$  lines describing the streets. You can print any valid solution.

```

1 int main()
2 {
3     fastIO();
4
5     int n, m, u, v;
6     vii minCut;
7
8     cin >> n >> m;
9
10    Dinic flow(n+1,1,n); // size n+1 to fix 0-
11    indexed indexes, 1 is the source (bank), 'n' is
12    the sink (harbor)
13
14    fori(i,0,m)
15    {
16        cin >> u >> v;
17        flow.addEdge(u,v,1);
18        flow.addEdge(v,u,1);
19    }
20
21    flow.maxFlow();
22    minCut = flow.minCut();
23
24    cout << (sz(minCut)/2) << endl;
25 }

```

```

23     for(int i = 0; i < sz(minCut); i += 2)
24         cout << minCut[i].fi << " " << minCut[i].se
        << endl;
25
26     return 0;
27 }

```

Listing 28: Main method for solving CSES 1695 Police Chase using MaxFlow template.

**School Dance** MaxFlow = MinCut = MaxMatching.

Following is the statement for the problem CSES 1696 (School Dance):

There are  $n$  boys and  $m$  girls in a school. Next week a school dance will be organized. A dance pair consists of a boy and a girl, and there are  $k$  potential pairs.

Your task is to find out the maximum number of dance pairs and show how this number can be achieved.

**Input**

The first input line has three integers  $n$ ,  $m$  and  $k$ : the number of boys, girls, and potential pairs. The boys are numbered  $1, 2, \dots, n$ , and the girls are numbered  $1, 2, \dots, m$ .

After this, there are  $k$  lines describing the potential pairs. Each line has two integers  $a$  and  $b$ : boy  $a$  and girl  $b$  are willing to dance together.

**Output**

First print one integer  $r$ : the maximum number of dance pairs. After this, print  $r$  lines describing the pairs. You can print any valid solution.

```

1  int main()
2  {
3      fastIO();

```

```

50         A *= A;
51         n >>= 1;
52     }
53     Matrix<ll> res = iden * ini;
54     cout << res.mat[0][0] << endl;
55     return 0;
56 }

```

Listing 34: Template to pow a matrix of size  $n$  to a certain exponent with logarithmic time (using binpow), and multiply it to another matrix, with modulo operation, as well as how to use it. Full implementation for calculating  $n$ -th Fibonacci term with linear recurrency.

### 9.1.9 Prime checking

```

1 bool prime( int n ){
2     if( n == 2 )
3         return true;
4     if( n % 2 == 0 || n <= 1 )
5         return false;
6     for( int i = 3; i * i <= n; i += 2 )
7         if( ( n % i ) == 0 )
8             return false;
9     return true;
10 }

```

Listing 35: Returns if  $n$  is a prime number in  $O(\sqrt{n})$ . Avoids overflow  $\forall n \leq 10^6$  ( $\approx INT\_MAX$ ).

### 9.1.10 Prime factorization

```

1 void prime_factorization(vll& factorization, ll n) {
2     for(long long d = 2; d*d <= n; d++) {
3         while(n % d == 0) {
4             factorization.push_back(d);
5             n /= d;

```

```

6         }
7     }
8     if( n > 1 )
9         factorization.push_back(n);
10 }

```

Listing 36: Returns prime factorization of the number  $n$  using *trial division*, simplest way. Runs in  $O(\sqrt{n})$ . e.g. for 12 the result is  $2 \times 2 \times 3$ .

### 9.1.11 Sieve of Eratosthenes

```

1 void sieve_of_eratosthenes(vector<bool>& is_prime,
2     int n) {
3     is_prime.assign(n+1,true);
4     is_prime[0] = is_prime[1] = false;
5     for(int i = 2; i <= n; i++) {
6         if( is_prime[i] && (long long)i * i <= n ) {
7             for(int j = i*i; j <= n; j += i)
8                 is_prime[j] = false;
9         }
10    }

```

Listing 37: Calculates every prime number up to  $n$  with sieve of eratosthenes in a boolean 1-indexed vector. Runs in  $O(n \log \log n)$ .

### 9.1.12 Sum of Divisors

```

1 ll sum_of_divisors(ll n) {
2     ll sum = 1;

```

```

3     for (long long i = 2; i * i <= n; i++) {
4         if(n % i == 0) {
5             int e = 0;
6             do {
7                 e++;
8                 n /= i;
9             } while (n % i == 0);
10            ll s = 0, pow = 1;
11            do {
12                s += pow;
13                pow *= i;
14            } while (e-- > 0);
15            sum *= s;
16        }
17    }
18    if(n > 1)
19        sum *= (1 + n);
20    return sum;
21 }

```

Listing 38: Calculates the sum of all divisors of number  $n$ . e.g.  $sum\_of\_divisors(12) = 18$ . Runs in  $O(\sqrt{n})$ .

```

1 void sum_of_divisors_sieve( vll& sigma, int n ) {
2     sigma.assign(n+1,0);
3     for(int i = 1; i <= n; i++)
4         for(int j = i; j <= n; j+=i)
5             sigma[j] += i;
6 }

```

Listing 39: Calculates the sum of all divisors of all numbers from 1 to  $n$ . Runs in  $O(n \log(n))$ .

## 9.2 Combinatorics

### 9.2.1 Binomial Coefficients

```

1  const int MAXN = 1e6+1;
2  vll fact(MAXN+1), inv(MAXN+1);
3  int binpow( ll a, ll b ) { // a^b
4      ll sol = 1;
5      a %= MOD;
6      while( b > 0 ) {
7          if( b & 1 )
8              sol = ( 1LL * sol * a ) % MOD;
9          a = ( 1LL * a * a ) % MOD;
10         b >>= 1;
11     }
12     return sol % MOD;
13 }
14 void combi() {
15     fact[0] = inv[0] = 1;
16     fori(i,1,MAXN+1) {
17         fact[i] = fact[i-1] * i % MOD;
18         inv[i] = binpow( fact[i], MOD - 2 );
19     }
20 }
21 ll nCr( ll n, ll r ) {

```

```

22     return fact[n] * inv[r] % MOD * inv[n-r] % MOD;
23 }
24 combi();
25 nCr(a,b);

```

Listing 40: Template for calculating binomial coefficients  $\binom{n}{k} = \frac{n!}{k!(n-k)!}$ . Precalculate *fact* and *inv* runs in  $O(MAXN \cdot \log_2(MOD))$  ( $\log_2(MOD) \approx 30$ ). So, in general case when  $NMAX = 10^6$  and  $MOD = 10^9 + 7$  can be generalized to  $O(n \cdot \log(n))$ ,  $n \leq 10^6$ .

### 9.2.2 Common combinatorics formulas

$$\binom{n}{2} = \frac{n(n-1)}{2} \quad (3)$$

$$\sum_{k=0}^n \binom{n}{k} = 2^n \quad (4)$$

$$\sum_{k=0}^n \binom{n}{k} \binom{n}{n-k} = \binom{2n}{n} \quad (5)$$

$$\sum_{k=0}^n k \binom{n}{k} = n2^{n-1} \quad (6)$$

$$\sum_{k=0}^{\infty} \binom{2k}{k} \binom{2n-2k}{n-k} = 4^n \quad (7)$$

$$(8)$$

## 10 Appendix

### 10.1 What to do against WA?

1. Have you done the correct complexity analysis?
2. Have you understood well the statement?
3. Have you corroborated yet the trivial test cases?
4. Have you checked all the corner cases?
5. Have you proposed a lot of non-trivial test cases?
6. Isn't there any possibility of overflow? (Multiplying two `int` needs to be fitted into a `long long`)
7. Have you done a desktop test?
8. Have you read all the variables? (`tc` variable on `main`)
9. Every part of your code works as it's meant to?

### 10.2 Primitive sizes

Data type	[B]	Minimum value it takes	Maximum value it takes
bool	1	0	1
signed char	1	0	255
unsigned char	1	-128	127
signed int	4	$-2,147,483,648 \approx -2 \times 10^9$	$2,147,483,647 \approx 2 \times 10^9$
unsigned int	4	0	$4,294,967,295 \approx 4 \times 10^9$
signed short	2	-32,768	32,767
unsigned short	2	0	65,535
signed long long int	8	$-9,223,372,036,854,775,808 \approx -9 \times 10^{18}$	$9,223,372,036,854,775,807 \approx 9 \times 10^{18}$
unsigned long long int	8	0	$18,446,744,073,709,551,615 \approx 18 \times 10^{18}$
float	4	$1.1 \times 10^{-38}$	$3.4 \times 10^{38}$
double	8	$2.2 \times 10^{-308}$	$1.7 \times 10^{308}$
long double	12	$3.3 \times 10^{-4932}$	$1.1 \times 10^{4932}$
