Contents

1 Template

```cpp
// Racso programmed here
#include <bits/stdc++.h>
using namespace std;
typedef long long ll;
typedef long double ld;
typedef __int128 sll;
typedef pair<int,int> ii;
typedef pair<ll,ll> pll;
typedef vector<int> vi;
typedef vector<ll> vll;
typedef vector<ii> vii;
typedef vector<vi> vvi;
typedef vector<vii> vvii;
typedef vector<pll> vpll;
typedef unsigned int uint;
typedef unsigned long long ull;
#define fi first
#define se second
#define pb push_back
#define all(v) v.begin(),v.end()
#define rall(v) v.rbegin(),v.rend()
#define sz(a) (int)(a.size())
#define fori(i,a,n) for(int i = a; i < n; i++)
#define endl '\n'
const int MOD = 1e9+7;
const int INFTY = INT_MAX;
const long long LLINF = LLONG_MAX;
const double EPS = DBL_EPSILON;
void printVector( auto& v ){ fori(i,0,sz(v)) cout <<
    v[i] << " "; cout << endl; }
void fastIO() { ios_base::sync_with_stdio(0); cin.
    tie(0); cout.tie(0); }
```

Listing 1: Racso's template.

2 C++ Sintaxis

2.1 Compilation sentences

To compile and execute in C++:

```
g++-13 -Wall -o solucion.exe solucion.cpp
g++ -std=c++20 -Wall -o main a.cpp ./solucion.exe < input.txt > output.txt
```

To compile and execute in Java:

```
javac -Xlint Solucion.java
java Solucion < input.txt > output.txt
```

To execute in Python (two options):

```
python3 solucion.py < input.txt > output.txt
pypy3 solucion.py < input.txt > output.txt
```

2.2 Custom comparators

```cpp
// Using function
bool cmpFunction(const pair<int,int> &a, const pair<
    int,int> &b) {
  return a.second < b.second;
```

```
4  }
5  sort(all(v), cmpFunction);
6  // Using functor
7  struct CmpFunctor {
8    bool operator()(const pair<int,int> &a, const pair
       <int,int> &b) const {
9      return a.second < b.second;
10   }
11 };
12 sort(all(v), CmpFunctor());
13 // Using lambda function
14 sort(all(v), [](const pair<int,int> &a, const pair<
      int,int> &b) {
15   return a.second < b.second;
16 });
```

Listing 2: Template for custom sorting, using as example ordering a vii ascending by second element.

2.3 *STL DS Usage

2.4 *Strings methods

2.5 Pragmas

```
1  #pragma GCC optimize("O3")
2  #pragma GCC target("avx2,bmi,bmi2,lzcnt,popcnt")
3  #pragma GCC optimize("unroll-loops")
```

Listing 3: Common pragmas.

2.6 Bit Manipulation Cheat Sheet

Bitwise operators:

- `&` (AND): Sets each bit to 1 if both bits are 1.
- `|` (OR): Sets each bit to 1 if al teast one bit is 1.
- `^` (XOR): Sets each bit to 1 if bits are different.
- `~` (NOT): Inverts all bits.
- `<<` (Left shift): Shifts bits left, fills with 0.
- `>>` (Right shift): Shifts bits right.

Basic Bit Tasks:

- Get bit: `(n & (1 << i)) != 0`
- Set bit: `n | (1 << i)`
- Clear bit: `n & ~(1 << i)`
- Toggle bit: `n ^(1 << i)`
- Clear LSB: `n & (n - 1)`
- Get LSB: `n & -n`

Set Operations:

- Subset check: `(A & B) == B`
- Set union: `A | B`
- Set intersection: `A & B`
- Set difference: `A & ~B`
- Toggle subset: `A ^B`

Gray code: `G = B` $\oplus$ `(B >> 1)`

2.7   Comparing Floats

```
1 long double a, b, EPS = 1e-9;
2 if( abs(a - b) < EPs ) {
3     // 'a' equals 'b'
4 }
```

Listing 4: Check if two real numbers are equal using an épsilon scope.

2.8   Ceil

$$\left\lceil \frac{a}{b} \right\rceil = \frac{a + b - 1}{b}$$

(Originally I though $\lceil \frac{a}{b} \rceil = \frac{a-1}{b} + 1$, but this calculates the wrong way in the cases where $a = 0$)

```
1 int myCeil(long long a, long long b) {
2     return (a + b - 1)/b;
3 }
```

Listing 5: A way to do ceil operation between integers without making explicit conversions. a and b are int, but the operation a+b-1 can cause an overflow, so they must be casted into long long to avoid this. The result must be int anyway.

3   Miscellaneous

3.1   Binary Search

```
1 int binary_search( vector<int>& list, int n, int
      target ) {
2     int x0 = 0, x1 = n-1, mid;
3     while( x0 <= x1 ) {
```

```
4         mid = (x0 + x1) / 2; // (x1 - x0) / 2 + x0;
5         if( list[mid] == target )
6             return mid;
7         list[mid] < target ? x0 = mid + 1 : x1 = mid
      - 1;
8     }
9     return -1;
10 }
```

Listing 6: Classic (Vanilla) implementation of Binary Search. Returns the index where `target` was found. Binary Search works on $O(log_2(n))$, let n be the size of the container.

```
1 int binary_search( vector<int>& list, int n, int
      target ) {
2     int ans = 0;
3     function<bool(int)> check = [&](int idx)->bool {
4         return idx < n && list[idx] <= target;
5     };
6     for( int i = 31; i >= 0; i-- ) {
7         if( check( ans + (1 << i) ) )
8             ans += 1 << i;
9     }
10     return list[ans] == target ? ans : -1;
11 }
```

Listing 7: Logarithmic jumps implementation of Binary Search. Returns the index where `target` was found. Binary Search works on $O(log_2(n))$, let n be the size of the container.

```
1  int binary_search( vector<int>& list, int n, int
     target ) {
2    int  left = 1, right = n + 1, mid;
3    while(right - left >= 1) {
4      mid = left + (right - left) / 2;
5      if( list[mid] >= target && target > list[mid -
     1]) {
6        //--------- TODO logic here ---------//
7        break;
8      }
9      else
10       if( list[mid] < target )
11         left = mid + 1;
12       else
13         right = mid;
14   }
15 }
```

Listing 8: Binary Search implementation for searching an element in the interval $(numbers_{i-1}, numbers_i]$. Originally used on Codeforces problem 474 - B (Worms). Returns the index where `target` was found. Binary Search works on $O(\log_2(n))$, let n be the size of the container.

```
1  function<bool(ll)> check = [&](ll t) -> bool {
2    ll products = 0;
3    for(ll machine : v) {
4      products += t / machine;
5      if( products >= target )
```

```
6        return true;
7    }
8    return products >= target;
9  };
10 for(int i = 0; i < 70; i++) {
11   mid = (x0 + x1) / 2;
12   check(mid) ? x1 = mid : x0 = mid + 1;
13 }
```

Listing 9: Implementation of Binary Search in the Answer. Originally used on CSES problem *Factory Machines*. Binary Search works on $O(\log_2(n))$, let n be the size of the container.

3.1.1 *Parallel Binary Search

3.1.2 *Ternary Search

3.2 Kadane's Algorithm

```
1  ll arns = v[0], maxSum = 0;
2  fori(i,0,n)
3  {
4    maxSum += v[i];
5    arns = max(arns, maxSum);
6    maxSum = max(0LL,maxSum);
7  }
```

Listing 10: Uses Kadane's Algorithm to find maximum subarray sum in $O(n)$.

4 Queries

4.1 Prefix Sum 2D

```cpp
for(int i = 1; i <= n; i++)
  for(int j = 1; j <= n; j++)
  {
    prefix[i][j] = prefix[i][j-1] + prefix[i-1][j] -
      prefix[i-1][j-1];
    prefix[i][j] += forest[i-1][j-1] == '*' ? 1 : 0;
  }
for(int i = 0; i < q; i++)
{
  pair<int,int> p1, p2;
  cin >> p1.fi >> p1.se >> p2.fi >> p2.se;
  int arns = prefix[p2.fi][p2.se];
  arns -= prefix[p2.fi][p1.se-1] + prefix[p1.fi-1][
    p2.se];
  arns += prefix[p1.fi-1][p1.se-1];
  cout << arns << endl;
}
```

Listing 11: Construction and querie of how many 1's are there in a matrix. Originally used on *Forest Queries* from CSES.

4.2 *Sparse Table

4.3 *Sqrt Decomposition

4.4 *Fenwick Tree

4.5 *Fenwick Tree 2D

4.6 Segment Tree

```cpp
typedef long long ll;
typedef vector<ll> vll;
typedef vector<int> vi;
const int INF = INT_MAX;
class Segment_tree {
  public: vll t;
  Segment_tree( int n = 1e5+10 ) {
    t.assign(n*4,INF);
  }
  void update(int node, int index, int tl, int tr,
  int val) {
    if( tr < index || tl > index ) return;
    if( tr == tl ) t[node] = val;
    else {
      int mid = tl + ((tr-tl)>>1);
      int lft = node << 1;
      int rght = lft + 1;
      update(lft,index,tl,mid,val);
      update(rght,index,mid+1,tr,val);
      t[node] = min(t[lft],t[rght]);
    }
  }
```

```
22    ll query(int node, int l, int r, int tl, int tr)
      {
23        if( tl > r || tr < l ) return INF;
24        if( tl >= l and tr <= r ) return t[node];
25        else {
26            int mid = tl + ((tr-tl)>>1);
27            int lft = node << 1;
28            int rght = lft + 1;
29            ll q1 = query(lft,l,r,tl,mid);
30            ll q2 = query(rght,l,r,mid+1,tr);
31            return min(q1,q2);
32        }
33    }
34    void build(vi &v, int node, int tl, int tr) {
35        if( tl == tr ) t[node] = v[tl];
36        else {
37            int mid = tl + ((tr-tl)>>1);
38            int lft = node << 1;
39            int rght = lft + 1;
40            build(v,lft,tl,mid);
41            build(v,rght,mid+1,tr);
42            t[node] = min(t[lft],t[rght]);
43        }
44    }
45 };
46 Segment_tree st(n);
47 st.build(v,1,0,n-1);
48 st.update(1,a-1,0,n-1,b);
```

```
49 st.query(1,a-1,b-1,0,n-1));
```

Listing 12: Segment Tree for Dynamic Range **Minimum** Queries. Racso's Implementation.

```
1  vector<long long> v, sex;
2  int n;
3  void build(int node, int l, int r){
4      if(l == r) sex[node] = v[l];
5      else{
6          int mid = (l+r)/2;
7          build(2*node, l, mid);
8          build(2*node + 1, mid+1, r);
9          sex[node] = sex[2*node] + sex[2*node +1];
10     }
11 }
12 void update(int node, int l, int r, int idx, int val
      ){
13     if(l == r){
14         v[idx] = val;
15         sex[node] = val;
16     }
17     else{
18         int mid = (l+r)/2;
19         if(l <= idx && idx <= mid) update(2*node, l,
      mid, idx, val);
20         else update(2*node +1, mid+1, r, idx, val);
21         sex[node] = sex[2*node] + sex[2*node + 1];
22     }
```

```
23 }
24 int query(int node, int tl, int tr, int l, int r){
25     if(r < tl || tr < l) return 0;
26     if(l <= tl && tr <= r) return sex[node];
27     int tm = (tl+tr)/2;
28     return query(2*node, tl, tm, l, r) + query(2*
         node +1, tm+1, tr, l, r);
29 }
30 v.resize(n);
31 sex.resize(4 * n);
32 build(1, 0, n - 1);
33 query(1, 0, n-1, l - 1, r - 1)
```

Listing 13: Segment Tree for Dynamic Range **Sum** Queries. Zum's Implementation.

4.6.1   *2D Segment Tree

4.6.2   *Persistent Segment Tree

4.6.3   *Lazy Propagation

4.7   Ordered Set

```
1 //<-- Header.
2 #include <bits/stdc++.h>
3 #include <ext/pb_ds/assoc_container.hpp>
4 #include <ext/pb_ds/tree_policy.hpp>
5 using namespace std;
6 using namespace __gnu_pbds;
7 template<typename T, typename Cmp = less<T>>
8 using ordered_set = tree<T,null_type,Cmp,rb_tree_tag
     ,tree_order_statistics_node_update>;
```

```
9  //<-- Declaration.
10 ordered_set<int> oset;
11 //<-- Methods usage.
12 // K-th element in a set (counting from zero).
13 ordered_set<int>::iterator it = oset.find_by_order(k
     );
14 // Number of items strictly smaller than k.
15 ordered_set<int>::iterator it = oset.order_of_key(k)
     ;
16 // Every other std::set method.
```

Listing 14: Ordered set necessary includes in header, declaration of the object, and usage of its new methods.

4.7.1   **Multi-Ordered Set**

```
1  //<-- Header.
2  #include <bits/stdc++.h>
3  #include <ext/pb_ds/assoc_container.hpp>
4  #include <ext/pb_ds/tree_policy.hpp>
5  using namespace std;
6  using namespace __gnu_pbds;
7  template<typename T, typename Cmp = less<T>>
8  using ordered_set = tree<T,null_type,Cmp,rb_tree_tag
      ,tree_order_statistics_node_update>;
9  //<-- Use in main.
10 ordered_set<pair<int,int>> multi_oset;
11 map<int,int> cuenta;
```

```
12  function<void(int)> insertar = [&](int val) -> void
       {
13     multi_oset.insert({val,++cuenta[val]});
14  };
15  function<void(int)> eliminar = [&](int val) -> void
       {
16     multi_oset.erase({val,cuenta[val]--});
17  };
```

Listing 15: Declaration of multi-oset structure.

4.8 *Treap

4.9 *Trie

5 Graph Theory

5.1 Breadth-First Search (BFS)

```
1  vector<vector<int>> graph;
2  vector<bool> visited;
3  graph.assign(n, vector<int>() ); // <--- main
4  visited.assign(n, false); // <--- main
5
6  void bfs( int s ) {
7    queue<int> q;
8    q.push( s );
9    visited[ s ] = true;
10   while( ! q.empty() ) {
11     int u = q.front();
12     q.pop();
```

```
13     for( auto v : graph[ u ] ) {
14       if( ! visited[ u ] ) {
15         visited[ u ] = true;
16         q.push( v );
17         // --- ToDo logic here ---
18       }
19     }
20   }
21   return;
22 }
```

Listing 16: Iterative implementation of BFS graph traversal over a graph represented as a AdjacencyList on vector of vectors. BFS runs in $O(|V| + |E|)$.

```
1  int n, m;
2  string arns = "";
3  cin >> n >> m;
4  vector<vector<bool>> visited(n,vector<bool>(m,false)
       );
5  vector<string> path(n,string(m,'O'));
6  vector<string> grid(n);
7  vii dirs = {{0,1},{0,-1},{1,0},{-1,0}};
8  string commands = "LRUD";
9  queue<ii> q;
10 ii start, end, curr;
11 function<bool(int,int)> valid = [&](int i, int j) ->
       bool {
12     return ( i >= 0 && i < n && j >= 0 && j < m &&
       grid[i][j] != '#' && ! visited[i][j] );
```

```cpp
13  };
14  fori(i,0,n) cin >> grid[i];
15  fori(i,0,n) {
16      fori(j,0,m)
17          if( grid[i][j] == 'A' ) {
18              visited[i][j] = true;
19              q.push( {i,j} );
20          }
21  }
22  while( ! q.empty() ) {
23      curr = q.front();
24      q.pop();
25      int i = curr.fi;
26      int j = curr.se;
27      if( grid[i][j] == 'B' ) {
28          end.fi = i;
29          end.se = j;
30          break;
31      }
32      int newI, newJ;
33      fori(I,0,4) {
34          newI = i + dirs[I].fi;
35          newJ = j + dirs[I].se;
36          if( valid(newI,newJ) ) {
37              visited[newI][newJ] = true;
38              q.push( {newI,newJ} );
39              path[newI][newJ] = commands[I];
40          }
```

```cpp
41      }
42  }
43  while( path[ end.fi ][ end.se ] != '0' ) {
44      fori(i,0,4) {
45          if( path[ end.fi ][ end.se ] == commands[i] )
            {
46              arns += i & 1 ? commands[i-1] : commands[i
                +1];
47              end.fi -= dirs[i].fi;
48              end.se -= dirs[i].se;
49          }
50      }
51  }
52  reverse(all(arns));
53  if( arns == "" ) cout << "NO" << endl;
54  else cout << "YES" << endl << arns.size() << endl <<
        arns << endl;
```

Listing 17: BFS on Grid to find shortest path from an starting point A to an end B. Once the path is found, it reconstruct it with movements $LRUD$. Works in $O(n \cdot m)$. Originally used on problem *Labyrinth* from CSES.

5.2   Deep-First Search (DFS)

```cpp
1  vector<vector<int>> graph;
2  vector<bool> visited;
3  graph.assign(n, vector<int>() ); // <--- main
4  visited.assign(n, false); // <--- main
5
```

```
6  void dfs( int s ) {
7      if( visited[s] == true ) return;
8      visited[s] = true;
9      vector<int>::iterator i;
10     for( i = graph[s].begin(); i < graph[s].end();
       ++i) {
11         if( ! visited[*i] ) {
12             // --- ToDo logic here ---
13             dfs(*i);
14         }
15     }
16 }
```

Listing 18: Recursive implementation of DFS graph traversal over a graph represented as a AdjacencyList on vector of vectors. DFS runs in $O(|V| + |E|)$.

```
1  vector<vector<int>> graph;
2  vector<bool> visited;
3  void dfs( int s ) {
4      stack<int> stk;
5      stk.push(s);
6      while (!stk.empty()) {
7          int u = stk.top();
8          stk.pop();
9          if ( visited[u] ) continue;
10         visited[u] = true;
11         // --- ToDo logic here ---
12         for(auto it = graph[u].rbegin(); it != graph
       [u].rend(); ++it)
```

```
13             if (!visited[*it])
14                 stk.push(*it);
15     }
16 }
```

Listing 19: Iterative implementation of DFS graph traversal over a graph represented as a AdjacencyList on vector of vectors. DFS runs in $O(|V| + |E|)$.

```
1  typedef long long ll;
2  vector<vector<ll>> adj;
3  vector<bool> visited;
4  function<void(ll)> dfs = [&](ll u) -> void {
5      if( visited[u] ) return;
6      visited[u] = true;
7      for( ll v : adj[u] )
8          dfs(v);
9  };
10 dfs(n);
```

Listing 20: DFS implementation with a lambda function (adjacency list and visited don't need to be passed thorough argument). DFS runs in $O(|V| + |E|)$.

```
1  typedef long long ll;
2  typedef vector<ll> vll;
3  map<ll,vll> adj;
4  set<ll> visited;
5  function<void(ll)> dfs = [&](ll u) -> void {
6      if( visited.count(u) ) return;
7      visited.insert(u);
8      for( ll v : adj[u] )
```

```
 9          dfs(v);
10  };
11  dfs(n);
```

Listing 21: DFS implementation with a lambda function implemented with a map instead of vector of vectors, and a set to track visited nodes. DFS runs in $O(|V| + |E|)$.

5.3 Shortest Path

5.3.1 Dijkstra's Algorithm

```
 1  typedef long long ll;
 2  typedef pair<ll,ll> pll;
 3
 4  vector<vector<ll>> graph;
 5  vector<ll> visited;
 6  graph.assign(n, vector<ll>() ); // <--- main
 7  visited.assign(n, false); // <--- main
 8
 9  vector<ll> dijkstra( int n, int source, vector<
       vector<pll>> &graph ) {
10    vector<ll> dist( n, INFTY );
11    priority_queue<pll, vector<pll>, greater<pll>> pq;
12    dist[ source ] = 0;
13    pq.push( {0, source} );
14    while( ! pq.empty() ) {
15      ll d = pq.top().first;
16      ll u = pq.top().second;
17      pq.pop();
18      if( d > dist[ u ] ) continue;
19      for( auto &edge : graph[ u ] ) {
20        ll v = edge.first;
21        ll weight = edge.second;
22        if( dist[ u ] + weight < dist[ v ] ) {
23          dist[ v ] = dist[ u ] + weight;
24          pq.push( {dist[ v ], v} );
25        }
26      }
27    }
28    return dist;
29  }
```

Listing 22: Iterative implementation of Dijkstra's Algorithm for shortest path over a graph represented as a AdjacencyList on vector of vectors. Returns a vector with the shortest path to every other vertex in the graph. $O(|E| \times log_2(|v|))$. doesn't work with negative weights.

```
 1  vvpll graph(n+1,vpll());
 2  vector<bool> visited(n+1,false);
 3  function<vll(int)> dijkstra = [&](int source) -> vll
       {
 4    vll dist(n+1,INF);
 5    priority_queue<pll,vpll,greater<pll>> pq;
 6    dist[source] = 0;
 7    pq.push({0,source});
 8    while( ! pq.empty() ) {
 9      ll d = pq.top().fi;
10      ll u = pq.top().se;
```

```
11        pq.pop();
12        if( d > dist[u] ) continue;
13        for(pll edge : graph[u]) {
14            ll v = edge.fi;
15            ll w = edge.se;
16            if( dist[u] + w < dist[v] ) {
17                dist[v] = dist[u] + w;
18                pq.push({dist[v],v});
19            }
20        }
21    }
22    return dist;
23 };
```

Listing 23: Iterative implementation of Dijkstra's Algorithm as a Lambda Function for shortest path over a graph represented as a AdjacencyList on vector of vectors. Returns a vector with the shortest path to every other vertex in the graph. $O(|E| \times log_2(|V|))$. Doesn't work with negative weights.

5.3.2   *Floyd-Warshall's Algorithm

5.3.3   Bellman–Ford Algorithm

```
1 int V, E;
2 cin >> V >> E;
3 vvi edges(E,vi(3,0));
4
5 for(int i = 1; i <= E; i++)
6   cin >> edges[i][0] >> edges[i][1] >> edges[i][2];
7
```

```
8  function<vi(int)> bellman_ford = [&](int src) -> vi
9  {
10   vi dist(V,INF);
11   dist[src] = 0;
12   for(int i = 0; i < V; i++)
13   {
14     for( vi edge : edges )
15     {
16         int u = edge[0];
17         int v = edge[1];
18         int w = edge[2];
19         if( dist[u] != INF and dist[u] + w < dist[v]
    )
20         {
21             if( i == V-1 )
22                 return = {-1};
23             dist[v] = dist[u] + w;
24         }
25     }
26   }
27   return dist;
28 };
```

Listing 24: Finds the shortest route from a source vertex, to every other one in the graph. Works over a list of edges. Runs in $O(|V| \times |E|)$. Can be used to find negative cycles.

74      }
75 };
```

Listing 27: 2-SAT implementation from `cp-algorithms.com`. Each component added is a expression of the form $a \vee b$, which is equivalent to $\neg a \Rightarrow b \wedge \neg b \Rightarrow a$ (if one of the variables is false, then the other one must be true). A directed graph is constructed based on these implication: For each x, there's two vertices v_x and $v_{\neg x}$. If there is an edge $a \Rightarrow b$, then there also is an edge $\neg b \Rightarrow \neg a$. For any x, if x is reachable from $\neg x$ and $\neg x$ is reachable from x, the problem has no solution. This means, each variable must be in a different SCC than their negative. This is verified by the method `solve_2SAT()`, which returns a boolean: `True` if it has a solution and `False` if it doesn't.

Giant Pizza How does a particular 2-SAT problem look like? Following is the statement for the problem CSES 1684 (Giant Pizza):

Uolevi's family is going to order a large pizza and eat it together. A total of n family members will join the order, and there are m possible toppings. The pizza may have any number of toppings. Each family member gives two wishes concerning the toppings of the pizza. The wishes are of the form "topping x is good/bad". Your task is to choose the toppings so that at least one wish from everybody becomes true (a good topping is included in the pizza or a bad topping is not included).

Input

The first input line has two integers n and m: the number of family members and toppings. The toppings are numbered $1, 2, \ldots, m$. After this, there are n lines describing the wishes. Each line has two wishes of the form " $+ x$" (topping x is good) or " $- x$" (topping x is bad).

Output

Print a line with m symbols: for each topping "+" if it is included and "-" if it is not included. You can print any valid solution. If there are no valid solutions, print "IMPOSSIBLE".

```
13        }
14
15        if(TwoSat.solve_2SAT()){
16            fori(i, 0, m){
17                if(TwoSat.assignment[i])
18                    cout << "+ ";
19                else
20                    cout << "- ";
21            }
22        }
23        else cout << "IMPOSSIBLE";
24        return 0;
25 }
```

Listing 28: Main method for solving CSES 1684 Giant Pizza using 2-SAT template.

27        start.fi = i;
28        start.se = j;
29      }
30    }
31  }
32  traverse(start.fi, start.se);
33    cout << arns << endl;
```

Listing 29: Traverse a matrix of 'n' x 'm' on grid representation. The matrix is composed of '.' for a valid space (empty), '#' for a wall, 'T' for a trap, and a number for a treasure. This implementation takes the sum of every treasure in the maze. The condition for moving to the next location is that there are no Traps nearby (up, down, left, right), so the player will never be killed while traversing. It also implements a way to read numerous test cases, but without knowing beforehand how many there are. Runs in $O(n \cdot m)$. Originally used on the problem *Treasures* from *2024-2025 ICPC Bolivia Pre-National Contest*.

Listing 31: Commented template for solving MaxFlow problems with Dinic's algorithm. Works in complexity $O(|V|^2 \times |E|)$. In bipartite graphs and graphs with unitary max capacity the complexity turns $O(|E| \times \sqrt{|V|})$.

Download Speed   How does a particular flow problem looks like? Following is the statement for the problem CSES 1694 (Download Speed):

> Consider a network consisting of n computers and m connections. Each connection specifies how fast a computer can send data to another computer.
>
> Kotivalo wants to download some data from a server. What is the maximum speed he can do this, using the connections in the network?
> **Input**
>
> The first input line has two integers n and m: the number of computers and connections. The computers are numbered $1, 2, \ldots, n$. Computer 1 is the server and computer n is Kotivalo's computer.
>
> After this, there are m lines describing the connections. Each line has three integers a, b, and c: computer a can send data to computer b at speed c.
> **Output**
>
> Print one integer: the maximum speed Kotivalo can download data.

```
1  int main()
2  {
3      fastIO();
4
5      int n, m, u, v, w;
6
7      cin >> n >> m;
8
9      Dinic flow(n+1,1,n); // size n+1 to fix 0-
```

```
          indexed indexes, 1 is the source (server), 'n' is

          the sink (Kotivalo)

10

11      fori(i,0,m)

12      {

13          cin >> u >> v >> w;

14          flow.addEdge(u,v,w);

15      }

16

17      cout << flow.maxFlow() << endl;

18

19      return 0;

20  }
```

Police Chase   Max Flow-Min Cut Theorem: MaxFlow = MinCut.
Following is the statement for the problem CSES 1695 (Police Chase):

Kaaleppi has just robbed a bank and is now heading to the harbor. However, the police wants to stop him by closing some streets of the city.

What is the minimum number of streets that should be closed so that there is no route between the bank and the harbor?

Input

The first input line has two integers n and m: the number of crossings and streets. The crossings are numbered $1, 2, \ldots, n$. The bank is located at crossing 1, and the harbor is located at crossing n.

After this, there are m lines that describing the streets. Each line has two integers a and b: there is a street between crossings a and b. All streets are two-way streets, and there is at most one street between two crossings.

Output

First print an integer k: the minimum number of streets that should be closed. After this, print k lines describing the streets. You can print any valid solution.

```
 1  int main()
 2  {
 3      fastIO();
 4
 5      int n, m, u, v;
 6      vii minCut;
 7
 8      cin >> n >> m;
 9
10      Dinic flow(n+1,1,n); // size n+1 to fix 0-
          indexed indexes, 1 is the source (bank), 'n' is
          the sink (harbor)
11
12      fori(i,0,m)
13      {
14          cin >> u >> v;
15          flow.addEdge(u,v,1);
16          flow.addEdge(v,u,1);
17      }
18
19      flow.maxFlow();
20      minCut = flow.minCut();
21
22      cout << (sz(minCut)/2) << endl;
```

```
23        for(int i = 0; i < sz(minCut); i += 2)
24            cout << minCut[i].fi << " " << minCut[i].se
          << endl;
25
26        return 0;
27 }
```

9.1.7 Binpow

```cpp
const int MOD = 1e9+7;
int binpow( long long a, long long b ) { // a^b
    long long sol = 1;
    a %= MOD;
    while( b > 0 ) {
        if( b & 1 )
```

```cpp
            sol = ( 1LL * sol * a ) % MOD;
        a = ( 1LL * a * a ) % MOD;
        b >>= 1;
    }
    return sol % MOD;
}
```

Listing 39: Applying binary exponentiation to a problem requiring $a^b \, mod(10^9 + 7)$ in $O(log_2(b))$.

9.1.8 Matrix Exponentiation (Linear Recurrence)

```cpp
template <typename T> void matmul(vector<vector<T>>
    &a, const vector<vector<T>>& b) {
    size_t n = a.size(), m = a[0].size(), p = b[0].
    size();
    assert(m == b.size());
    vector<vector<T>> c(n,vector<T>(p));
    for(size_t i = 0; i < n; i++)
        for(size_t j = 0; j < p; j++)
            for(size_t k = 0; k < m; k++)
                c[i][j] = (c[i][j] + a[i][k] * b[k][j])
    % MOD;
    a = c;
}
template <typename T> struct Matrix {
    vector<vector<T>> mat;
    Matrix() {}
    Matrix(vector<vector<T>> a) { mat = a; }
```

```
15    Matrix(int n, int m) {
16        mat.resize(n);
17        for(int i = 0; i < n; i++) {mat[i].resize(m);
18        }
18    }
19    int rows() const { return mat.size(); }
20    int cols() const { return mat[0].size(); }
21    void makeIden() {
22        for(int i = 0; i < rows(); i++)
23            for(int j = 0; j < cols(); j++)
24                mat[i][j] = (i == j ? 1 : 0);
25    }
26    Matrix operator*=(const Matrix &b) {
27        matmul(mat, b.mat);
28        return *this;
29    }
30    void print() {
31        for(int i = 0; i < rows(); i++) {
32            for(int j = 0; j < cols(); j++)
33                cout << mat[i][j] << " ";
34            cout << endl;
35        }
36    }
37    Matrix operator*(const Matrix &b) { return Matrix
      (*this) *= b; }
38 };
39 int main() {
40    Matrix<ll> A( {{1,1},{1,0}} );
```

```
41    Matrix<ll> ini(2,1);
42    ini.mat[0][0] = 0;
43    ini.mat[1][0] = 1;
44    Matrix<ll> iden(2,2);
45    iden.makeIden();
46    ll n;
47    cin >> n;
48    while(n > 0) {
49        if( n & 1 ) iden *= A;
50        A *= A;
51        n >>= 1;
52    }
53    Matrix<ll> res = iden * ini;
54    cout << res.mat[0][0] << endl;
55    return 0;
56 }
```

Listing 40: Template to pow a matrix of size n to a certain exponent with logarithmic time (using binpow), and multiply it to another matrix, with modulo operation, as well as how to use it. Full implementation for calculating `n-th` Fibonacci term with linear recurrency.

9.1.9   Prime checking

```
1 bool prime( int n ){
2     if( n == 2 )
3         return true;
4     if( n % 2 == 0 || n <= 1 )
5         return false;
```

```
6        for( int i = 3; i * i <= n; i += 2 )
7                if( ( n % i ) == 0 )
8                    return false;
9        return true;
10 }
```

Listing 41: Returns if n is a prime number in $O(\sqrt{n})$. Avoids overflow $\forall\ n \le 10^6$ ($\approx INT\_MAX$).

9.1.10 Prime factorization

```
1 void prime_factorization(vll& factorization, ll n) {
2     for(long long d = 2; d*d <= n; d++) {
3         while(n % d == 0) {
4             factorization.push_back(d);
5             n /= d;
6         }
7     }
8     if( n > 1 )
9         factorization.push_back(n);
10 }
```

Listing 42: Returns prime factorization of the number n using *trial division*, simplest way. Runs in $O(\sqrt{n})$. e.g. for 12 the result is 2x2x3.

9.1.11 Sieve of Eratosthenes

```
1 void sieve_of_eratosthenes(vector<bool>& is_prime,
2     int n) {
3     is_prime.assign(n+1,true);
```

```
3    is_prime[0] = is_prime[1] = false;
4    for(int i = 2; i <= n; i++) {
5        if( is_prime[i] && (long long)i * i <= n ) {
6            for(int j = i*i; j <= n; j += i)
7                is_prime[j] = false;
8        }
9    }
10 }
```

Listing 43: Calculates every prime number up to n with sieve of eratosthenes in a boolean 1-indexed vector. Runs in $O(n\ log\ log\ n)$.

9.1.12 Sum of Divisors

```
1 ll sum_of_divisors(ll n) {
2    ll sum = 1;
3    for (long long i = 2; i * i <= n; i++) {
4        if(n % i == 0) {
5            int e = 0;
6            do {
7                e++;
8                n /= i;
9            } while (n % i == 0);
10           ll s = 0, pow = 1;
11           do {
12               s += pow;
13               pow *= i;
14           } while (e-- > 0);
15           sum *= s;
```

```
16        }
17    }
18    if(n > 1)
19        sum *= (1 + n);
20    return sum;
21 }
```

Listing 44: Calculates the sum of all divisors of number n. e.g. $sum\_of\_divisors(12) = 18$. Runs in $O(\sqrt{n})$.

```
1 void sum_of_divisors_sieve( vll& sigma, int n ) {
2     sigma.assign(n+1,0);
3     for(int i = 1; i <= n; i++)
4         for(int j = i; j <= n; j+=i)
5             sigma[j] += i;
6 }
```

Listing 45: Calculates the sum of all divisors of all numbers from 1 to n. Runs in $O(n\log(n))$.

9.2 Combinatorics

9.2.1 Binomial Coefficients

```
1 const int MAXN = 1e6+1;
2 vll fact(MAXN+1), inv(MAXN+1);
3 int binpow( ll a, ll b ) { // a^b
4     ll sol = 1;
5     a %= MOD;
6     while( b > 0 ) {
```

```
7             if( b & 1 )
8                 sol = ( 1LL * sol * a ) % MOD;
9             a = ( 1LL * a * a ) % MOD;
10            b >>= 1;
11        }
12        return sol % MOD;
13 }
14 void combi() {
15     fact[0] = inv[0] = 1;
16     fori(i,1,MAXN+1) {
17         fact[i] = fact[i-1] * i % MOD;
18         inv[i] = binpow( fact[i], MOD - 2 );
19     }
20 }
21 ll nCr( ll n, ll r ) {
22     return fact[n] * inv[r] % MOD * inv[n-r] % MOD;
23 }
24 combi();
25 nCr(a,b);
```

Listing 46: Template for calculating binomial coefficients $\binom{n}{k} = \frac{n!}{k!\,(n-k)!}$. Precalculate *fact* and *inv* runs in $O(MAXN \cdot log_2(MOD))$ ($log_2(MOD) \approx 30$). So, in general case when $NMAX = 10^6$ and $MOD = 10^9 + 7$ can be generalizad to $O(n \cdot log(n))$, $n \leq 10^6$.

9.2.2   Common combinatorics formulas

$$\binom{n}{2} = \frac{n(n-1)}{2} \tag{3}$$

$$\sum_{k=0}^{n}\binom{n}{k} = 2^n \tag{4}$$

$$\sum_{k=0}^{n}\binom{n}{k}\binom{n}{n-k} = \binom{2n}{n} \tag{5}$$

$$\sum_{k=0}^{n}k\binom{n}{k} = n2^{n-1} \tag{6}$$

$$\sum_{k=0}^{\infty}\binom{2k}{k}\binom{2n-2k}{n-k} = 4^n \tag{7}$$

$$\tag{8}$$

10   Appendix

10.1   What to do against WA?

1. Have you done the correct complexity analysis?

2. Have you understood well the statement?

3. Have you corroborated yet the trivial test cases?

4. Have you checked all the corner cases?

5. Have you proposed a lot of non-trivial test cases?

6. Isn't there any posisbilitie of overflow? (Multiplying two `int` needs to be fitted into a `long long`)

7. Have you done a desktop test?

8. Have you red all the variables? (`tc` variable on `main`)

9. Every part of your code works as it's meant to?

10.2   Primitive sizes

Data type	[B]	Minimun value it takes	Maximum value it takes
bool	1	0	1
signed char	1	0	255
unsigned char	1	-128	127
signed int	4	$-2{,}147{,}483{,}648 \approx -2\times10^9$	$2{,}147{,}483{,}647 \approx 2\times10^9$
unsigned int	4	0	$4{,}294{,}967{,}295 \approx 4\times10^9$
signed short	2	-32,768	32,767
unsigned short	2	0	65,535
signed long long int	8	$-9{,}223{,}372{,}036{,}854{,}775{,}808 \approx -9\times10^{18}$	$9{,}223{,}372{,}036{,}854{,}775{,}807 \approx 9\times10^{18}$
unsigned long long int	8	0	$18{,}446{,}744{,}073{,}709{,}551{,}615 \approx 18\times10^{18}$
float	4	1.1×10^{-38}	3.4×10^{38}
double	8	2.2×10^{-308}	1.7×10^{308}
long double	12	3.3×10^{-4932}	1.1×10^{4932}
