1 Template

```

1 // Racso programmed here
2 #include <bits/stdc++.h>
3 using namespace std;
4 typedef long long ll;
5 typedef long double ld;
6 typedef __int128 sll;
7 typedef pair<int,int> ii;
8 typedef pair<ll,ll> pll;
9 typedef vector<int> vi;
10 typedef vector<ll> vll;
11 typedef vector<ii> vii;
12 typedef vector<vi> vvi;
13 typedef vector<vii> vvii;
14 typedef vector<pll> vpll;
15 typedef vector<vll> vvll;
16 typedef vector<vpll> vvppll;
17 typedef unsigned int uint;
18 typedef unsigned long long ull;
19 #define fi first
20 #define se second
21 #define pb push_back
22 #define all(v) v.begin(),v.end()
23 #define rall(v) v.rbegin(),v.rend()
24 #define sz(a) (int)(a.size())
25 #define fori(i,a,n) for(int i = a; i < n; i++)
26 #define endl '\n'

```

```

27 const int MOD = 1e9+7;
28 const int INF = INT_MAX;
29 const long long LLINF = LLONG_MAX;
30 const double EPS = DBL_EPSILON;
31 void printVector( auto& v ){ fori(i,0,sz(v)) cout <<
    v[i] << " "; cout << endl; }
32 void fastIO() { ios_base::sync_with_stdio(0); cin.
    tie(0); cout.tie(0); }

```

Listing 1: Racso's template.

2 C++ Sintaxis

2.1 Compilation sentences

To compile and execute in C++:

```

g++-13 -Wall -o solution.exe solution.cpp
g++ -std=c++20 -Wall -o main a.cpp ./solution.exe < input.txt > output.txt

```

To compile and execute in Java:

```

javac -Xlint Solution.java
java Solution < input.txt > output.txt

```

To execute in Python (two options):

```

python3 solution.py < input.txt > output.txt
pypy3 solution.py < input.txt > output.txt

```

2.2 Custom comparators

```

1 // Using function
2 bool cmpFunction(const pair<int,int> &a, const pair<
    int,int> &b) {

```

```

3   return a.second < b.second;
4 }
5 sort(all(v), cmpFunction);
6 // Using functor
7 struct CmpFunctor {
8     bool operator()(const pair<int,int> &a, const pair
        <int,int> &b) const {
9         return a.second < b.second;
10    }
11 };
12 sort(all(v), CmpFunctor());
13 // Using lambda function
14 sort(all(v), [](const pair<int,int> &a, const pair<
        int,int> &b) {
15     return a.second < b.second;
16 });

```

Listing 2: Template for custom sorting, using as example ordering a vii ascending by second element.

2.3 STL DS Usage

std::string

find

```

size_t find (const string& str, size_t pos = 0) const;
size_t find (const char* s, size_t pos = 0) const;
size_t find (const char* s, size_t pos, size_t n) const;
size_t find (char c, size_t pos = 0) const;
str    Another string with the subject to search for.

```

pos position of the first character in the string to be considered in the search. If this is greater than the string length, the function never finds matches. note: the first character is denoted by a value of 0.

s Pointer to an array of characters. If argument n is specified, the sequence to match are the first n characters in the array. Otherwise, a null-terminated sequence is expected.

n Length of sequence of characters to match.

c Individual character to be searched for.

Return — The position of the first character of the first match. If no matches were found, the function returns string::npos.

Complexity — Unspecified, but generally up to linear in length()-pos times the length of the sequence to match (worst case).

Note — This is a note.

2.4 Pragma

```

1 #pragma GCC optimize("O3")
2 #pragma GCC target("avx2,bmi,bmi2,lzcnt,popcnt")
3 #pragma GCC optimize("unroll-loops")

```

Listing 3: Common pragmas.

2.5 Bit Manipulation Cheat Sheet

Bitwise operators:

- $\&$ (AND): Sets each bit to 1 if both bits are 1.
- $|$ (OR): Sets each bit to 1 if at least one bit is 1.
- $\wedge$ (XOR): Sets each bit to 1 if bits are different.
- $\sim$ (NOT): Inverts all bits.
- $\ll$ (Left shift): Shifts bits left, fills with 0.
- $\gg$ (Right shift): Shifts bits right.

Basic Bit Tasks:

- Get bit: $(n \& (1 \ll i)) \neq 0$
- Set bit: $n | (1 \ll i)$
- Clear bit: $n \& \sim(1 \ll i)$
- Toggle bit: $n \wedge (1 \ll i)$
- Clear LSB: $n \& (n - 1)$
- Get LSB: $n \& -n$

Set Operations:

- Subset check: $(A \& B) == B$
- Set union: $A | B$
- Set intersection: $A \& B$
- Set difference: $A \& \sim B$
- Toggle subset: $A \hat{=} B$

Equations:

Properties of bitwise:

- $a | b = a \oplus b + a \& b$

$$\bullet a \oplus (a \& b) = (a | b) \oplus b$$

$$\bullet b \oplus (a \& b) = (a | b) \oplus a$$

$$\bullet (a \& b) \oplus (a | b) = a \oplus b$$

In addition and subtraction:

$$\bullet a + b = (a | b) + (a \& b)$$

$$\bullet a + b = a \oplus b + 2(a \& b)$$

$$\bullet a - b = (a \oplus (a \& b)) - ((a | b) \oplus a)$$

$$\bullet a - b = ((a | b) \oplus b) - ((a | b) \oplus a)$$

$$\bullet a - b = (a \oplus (a \& b)) - (b \oplus (a \& b))$$

$$\bullet a - b = ((a | b) \oplus b) - (b \oplus (a \& b))$$

$$\text{Gray code: } G = B \oplus (B \gg 1)$$

C++ built in functions:

- `__builtin_popcount(x)` - Count the number of set bits in x.
- `__builtin_clz(x)` - Count the number of leading zeros in x.
- `__builtin_ctz(x)` - Count the number of trailing zeros in x.

2.6 Comparing Floats

```
1 long double a, b, EPS = 1e-9;
2 if( abs(a - b) < EPS ) {
3     // 'a' equals 'b'
4 }
```

Listing 4: Check if two real numbers are equal using an epsilon scope.

2.7 Input Parsing

```
1 #include <bits/stdc++.h>
2 using namespace std;
3
4 vector<string> splitLine() {
5     string line;
6     getline(cin, line);
7     vector<string> tokens;
8     stringstream ss(line);
9     string token;
10    while (ss >> token) tokens.push_back(token);
11    return tokens;
12 }
13
14 /*
15 Usage example:
16 int main() {
17     fastIO();
18     int n; cin >> n;
19     cin.ignore(); // ignore newline after reading n
20
21     for (int i = 0; i < n; i++) {
22         vector<string> line = splitLine();
23         // process line...
24     }
25 }
26 */
```

Listing 5: Parses input line by line. Reads a full line and splits it by spaces into a vector of strings. Complexity: $O(L)$ time and memory, where L is the length of the line.

2.8 Regex

```
1 #include <bits/stdc++.h>
2 using namespace std;
3
4 // First occurrence of pattern in s, or "" if there
   is none.
5 string findFirst(string s, string pattern) {
6     smatch m;
7     if (regex_search(s, m, regex(pattern))) return m
   .str();
8     return "";
9 }
10
11 // All occurrences of pattern in s.
12 // Note: sregex_iterator requires a named regex; a
   temporary is a compile error in C++20+.
13 vector<string> findAll(string s, string pattern) {
14     vector<string> results;
15     regex re(pattern);
16     sregex_iterator it(s.begin(), s.end(), re);
17     sregex_iterator end;
18     while (it != end) {
```

```

19     results.push_back(it->str());
20     it++;
21 }
22 return results;
23 }
24
25 /*
26 Common patterns:
27
28 Integer validation:
29 regex_match(s, regex(R"(^-?\d+$)"))          //
    integer (possibly negative)
30 regex_match(s, regex(R"(/^\d+$)"))            //
    non-negative integer
31 regex_match(s, regex(R"^[1-9]\d*$)"))         //
    integer without leading zeros
32
33 Decimal number:
34 regex_match(s, regex(R"(^-?\d+(\.\d+)?$)"))    //
    integer or decimal
35 regex_match(s, regex(R"(^-?\d+\.\d+$)"))        //
    strictly decimal (has dot)
36
37 Subscript/superscript (e.g. Bad Latex):
38 regex_match(s, regex(R"([a-zA-Z0-9]+_\{\d+\})"))
    // X_{Y} where Y is integer
39 regex_match(s, regex(R"([a-zA-Z0-9]+\^\{\d+\})"))
    // X^{Y} where Y is integer

```

```

40 findAll(s, R"([a-zA-Z0-9]+_\{\d+\})")
    // all sub/superscripts
41
42 Extract numbers:
43 findAll(s, R"(\d+)")                          //
    sequences of digits
44 findAll(s, R"(-?\d+(\.\d+)?")")                //
    integers and decimals
45
46 Other:
47 regex_match(s, regex(R"^[a-zA-Z]+$)"))          //
    only letters
48 regex_match(s, regex(R"^[a-zA-Z0-9]+$)"))        //
    alphanumeric
49 regex_match(s, regex(R"^[a-zA-Z0-9 ]+$)"))       //
    alphanumeric with spaces
50 */

```

Listing 6: Patterns for validating integers, decimals, and subscript/superscript formats, plus the helpers `findFirst` and `findAll`. Complexity: $O(n)$ per search for simple patterns (n = length of the string); worst case exponential due to the backtracking engine. Prefer compiling the regex once ($O(p)$, p = pattern length) and reusing it. Requires C++11 or later.

2.9 Ceil

$$\left\lceil \frac{a}{b} \right\rceil = \frac{a + b - 1}{b}$$

(Originally I though $\left\lceil \frac{a}{b} \right\rceil = \frac{a-1}{b} + 1$, but this calculates the wrong way in the cases where $a = 0$)

```

1 int myCeil(long long a, long long b) {
2     return (a + b - 1)/b;
3 }

```

Listing 7: A way to do ceil operation between integers without making explicit conversions. `a` and `b` are `int`, but the operation `a+b-1` can cause an overflow, so they must be casted into `long long` to avoid this. The result must be `int` anyway.

3 Miscellaneous

3.1 Binary Search

```

1 int binary_search( vector<int>& list, int n, int
   target ) {
2     int x0 = 0, x1 = n-1, mid;
3     while( x0 <= x1 ) {
4         mid = x0 + (x1 - x0) / 2; // overflow-safe:
   (x0+x1)/2 can overflow int
5         if( list[mid] == target )
6             return mid;
7         list[mid] < target ? x0 = mid + 1 : x1 = mid
   - 1;
8     }
9     return -1;
10 }

```

Listing 8: Classic (Vanilla) implementation of Binary Search. Returns the index where `target` was found. Binary Search works on $O(\log_2(n))$, let n be the size of the container.

```

1 int binary_search_log( vector<int>& list, int n, int
   target ) {
2     int ans = 0;
3     function<bool(int)> check = [&](int idx)->bool {
4         return idx < n && list[idx] <= target;
5     };
6     if( list.empty() ) return -1;
7     for( int i = 30; i >= 0; i-- ) { // 30 covers
   any n <= 2^31-1 without overflowing int
8         if( check( ans + (1 << i) ) )
9             ans += 1 << i;
10    }
11    return list[ans] == target ? ans : -1;
12 }

```

Listing 9: Logarithmic jumps implementation of Binary Search. Returns the index where `target` was found. Binary Search works on $O(\log_2(n))$, let n be the size of the container.

```

1 function<bool(ll)> check = [&](ll t) -> bool {
2     ll products = 0;
3     for(ll machine : v) {
4         products += t / machine;
5         if( products >= target )
6             return true;
7     }
8     return products >= target;
9 };

```

```

10 for(int i = 0; i < 70; i++) {
11     mid = (x0 + x1) / 2;
12     check(mid) ? x1 = mid : x0 = mid + 1;
13 }

```

Listing 10: Implementation of Binary Search in the Answer. Originally used on CSES problem *Factory Machines*. Binary Search works on $O(\log_2(n))$, let n be the size of the container.

3.1.1 *Parallel Binary Search

3.1.2 *Ternary Search

3.2 Kadane's Algorithm

```

1 ll arns = v[0], maxSum = 0;
2 for(i,0,n)
3 {
4     maxSum += v[i];
5     arns = max(arns, maxSum);
6     maxSum = max(0LL, maxSum);
7 }

```

Listing 11: Uses Kadane's Algorithm to find maximum subarray sum in $O(n)$.

3.3 Coordinate Compression

```

1 //Previously read vector<int> a(n)
2 vector<int> coords = a;
3 sort(all(coords));
4 coords.erase(unique(all(coords)), coords.end()); //
    erases duplicates

```

```

5 //Reassings every value in vector "a" to the new
    corresponding value
6 for(int &x : a) x = lower_bound(all(coords), x) -
    coords.begin();

```

Listing 12: Coordinate Compression implementation for a vector of integers. Replaces elements in the original vector to newly assigned minimal numbers. Runs in $O(n\log(n))$.

4 Queries

4.1 Prefix Sum 2D

```

1 for(int i = 1; i <= n; i++)
2     for(int j = 1; j <= m; j++)
3     {
4         prefix[i][j] = prefix[i][j-1] + prefix[i-1][j] -
            prefix[i-1][j-1];
5         prefix[i][j] += forest[i-1][j-1] == '*' ? 1 : 0;
6     }
7 for(int i = 0; i < q; i++)
8 {
9     pair<int,int> p1, p2;
10    cin >> p1.fi >> p1.se >> p2.fi >> p2.se;
11    int arns = prefix[p2.fi][p2.se];
12    arns -= prefix[p2.fi][p1.se-1] + prefix[p1.fi-1][
        p2.se];
13    arns += prefix[p1.fi-1][p1.se-1];
14    cout << arns << endl;

```

```
15 }
```

Listing 13: Construction and query of how many 1's are there in a matrix. Originally used on *Forest Queries* from CSES.

4.2 Sqrt Decomposition

4.2.1 Mo's Algorithm

```
1 struct Query{
2     int l, r, idx;
3 };
4 //vector queries ya leido y 0-indexado anteriormente
5 int block_size = (int)sqrt(n);
6 auto mo_cmp = [&](Query a, Query b) { //custom
7     cmptor
8     int block_a = a.l / block_size;
9     int block_b = b.l / block_size;
10    if(block_a != block_b) return block_a < block_b;
11    if(block_a & 1) return a.r < b.r; //zig-zag
12    sorting
13    return a.r > b.r;
14 };
15 sort(all(queries), mo_cmp);
```

Listing 14: Offline query ordering for Mo's Algorithm. Sorts the queries by block of the left endpoint, alternating the right endpoint order per block (zig-zag) to reduce moves. The sort itself runs in $O(q \log(q))$; the whole algorithm runs in $O((n + q)\sqrt{n} \cdot F)$, where F is the cost of an update (usually $O(1)$ or $O(\log(n))$).

4.3 Fenwick Tree (BIT)

Let f be some group operation (a binary **associative** function over a set with an **identity** and **inverse** elements) and A be an array of integers of length N . Denote f 's infix function as $*$; that is, $f(x, y) = x * y$ for arbitrary integers x, y .

The Fenwick tree is a data structure which:

- Calculates the value of function f in the given range $[l, r]$ (i.e. $A_l * A_{l+1} * \dots * A_r$) in $O(\log_N)$ time.
- Updates the value of an element of A in $O(\log_N)$ time.

Operations supported by BIT: sum, XOR, counting frequencies, order statistics.

Operations not supported by BIT: minimum, maximum, gcd, and / or.

BIT basically obtains ranges by subtracting prefixes: $range(l, r) = prefix(r) * prefix(l - 1)$.

```
1 template<typename T = long long>
2 struct BIT {
3     int n;
4     vector<T> tree;
5     BIT(int n) : n(n), tree(n+1, 0) {}
6     BIT(vector<T> const &v) : BIT( v.size() ) {
7         for(size_t i = 0; i < v.size(); i++)
8             update(i+1, v[i]);
9     }
10    void update(int idx, T val) {
11        while( idx <= n ) {
12            tree[idx] += val;
13            idx += idx & -idx;
14        }
15    }
16    T prefix(int idx) const {
17        T pref = 0;
```

```

18     while( idx > 0 ) {
19         pref += tree[idx];
20         idx -= idx & -idx;
21     }
22     return pref;
23 }
24 T query(int l, int r) const {
25     return prefix(r) - prefix(l-1);
26 }
27 };

```

Listing 15: BIT implementation for sum queries. Builds in $O(n \log n)$, queries in $O(\log n)$.

4.3.1 2D Fenwick Tree (BIT)

```

1  template<typename T = long long>
2  struct BIT2D {

54 else cout << "YES" << endl << arns.size() << endl <<
    arns << endl;

```

Listing 24: BFS on Grid to find shortest path from an starting point A to an end B . Once the path is found, it reconstruct it with movements $LRUD$. Works in $O(n \cdot m)$. Originally used on problem *Labyrinth* from CSES.

5.2 Deep-First Search (DFS)

```

1 vector<vector<int>>> graph;
2 vector<bool> visited;
3 void dfs( int s ) {
4     stack<int> stk;
5     stk.push(s);
6     while (!stk.empty()) {
7         int u = stk.top();
8         stk.pop();
9         if ( visited[u] ) continue;
10        visited[u] = true;
11        // --- ToDo logic here ---
12        for(auto it = graph[u].rbegin(); it != graph
[u].rend(); ++it)
13            if (!visited[*it])

```

```

14            stk.push(*it);
15        }
16    }

```

Listing 25: Iterative implementation of DFS graph traversal over a graph represented as a AdjacencyList on vector of vectors. DFS runs in $O(|V| + |E|)$.

```

1 typedef long long ll;
2 vector<vector<ll>>> adj;
3 vector<bool> visited;
4 function<void(ll)> dfs = [&](ll u) -> void {
5     if( visited[u] ) return;
6     visited[u] = true;
7     for( ll v : adj[u] )
8         dfs(v);
9 };
10 dfs(n);

```

Listing 26: DFS implementation with a lambda function (adjacency list and visited don't need to be passed thorough argument). DFS runs in $O(|V| + |E|)$.

5.3 Shortest Path

5.3.1 Dijkstra's Algorithm

```

1 vvp11 graph(n+1,vp11());
2 function<v11(int)> dijkstra = [&](int source) -> v11
{
3     v11 dist(n+1,INF);
4     priority_queue<p11,vp11,greater<p11>> pq;

```

```

5   dist[source] = 0;
6   pq.push({0,source});
7   while( ! pq.empty() ) {
8       ll d = pq.top().fi;
9       ll u = pq.top().se;
10      pq.pop();
11      if( d > dist[u] ) continue;
12      for(pll edge : graph[u]) {
13          ll v = edge.fi;
14          ll w = edge.se;
15          if( dist[u] + w < dist[v] ) {
16              dist[v] = dist[u] + w;
17              pq.push({dist[v],v});
18          }
19      }
20  }
21  return dist;
22 };

```

Listing 27: Iterative implementation of Dijkstra's Algorithm as a Lambda Function for shortest path over an adjacency list. Returns a vector with the shortest distance to every other vertex in the graph. $O(|E| \times \log_2(|V|))$. Doesn't work with negative weights.

5.3.2 Bellman–Ford Algorithm

```

1  int V, E;
2  cin >> V >> E;
3  vvi edges(E,vi(3,0));

```

```

4  for(int i = 0; i < E; i++)
5      cin >> edges[i][0] >> edges[i][1] >> edges[i][2];
6  function<vi(int)> bellman_ford = [&](int src) -> vi
7  {
8      vi dist(V,INF);
9      dist[src] = 0;
10     for(int i = 0; i < V; i++) {
11         for( vi edge : edges ) {
12             int u = edge[0];
13             int v = edge[1];
14             int w = edge[2];
15             if( dist[u] != INF and dist[u] + w < dist[v] ) {
16                 if( i == V-1 )
17                     return {-1};
18                 dist[v] = dist[u] + w;
19             }
20         }
21     }
22     return dist;
23 };

```

Listing 28: Finds the shortest route from a source vertex, to every other one in the graph. Works over a list of edges. Runs in $O(|V| \times |E|)$. Can be used to find negative cycles.

5.3.3 Floyd-Warshall Algorithm

```

1  vvll dist(n+1,vll(n+1,INF));
2  for(int i = 1; i <= n; i++)

```

```

3   dist[i][i] = 0;
4   for(int i = 0; i < m; i++) {
5       dist[u][v] = w;
6       dist[v][u] = w;
7   }
8   function<void()> floyd_warshall = [&]() -> void {
9       for(int k = 1; k <= n; k++)
10          for(int i = 1; i <= n; i++)
11             for(int j = 1; j <= n; j++)
12                 if( dist[i][k] < INF and dist[k][j] < INF )
13                     dist[i][j] = min( dist[i][j], dist[i][k] +
14                                     dist[k][j] );
15   };

```

Listing 29: Implementation of Floyd Warshall's Algorithm for finding APSP (*All Pairs Shortest Path*). Runs in $O(|V|^3)$, work with negative weights and can detect negative cycles (if $\text{dist}[i][i] < 0$).

5.4 Minimum Spanning Tree (MST)

5.4.1 Prim's Algorithm

```

1   function<ll()> prim = [&]() -> ll
2   {
3       priority_queue<pll,vpll,greater<pll>> pq;
4       ll res = 0;
5       pq.push({0,1});
6       while( ! pq.empty() )
7       {
8           pll p = pq.top();

```

```

9       pq.pop();
10      ll w = p.fi;
11      int u = p.se;
12      if( visited[u] ) continue;
13      res += w;
14      visited[u] = true;
15      for(pll v : graph[u])
16          if( ! visited[v.fi] )
17              pq.push({v.se,v.fi});
18  }
19  for(int i = 1; i <= V; i++)
20      if( ! visited[i] )
21          return -1;
22  return res;
23 };

```

Listing 30: Implementation of Prim's Algorithm that returns the total weight of the MST in a adjacency list. Runs in $O(|E|\log|V|)$.

5.4.2 *Kruskal's Algorithm

5.5 Bipartite Checking

```

1   vi cnt(3,0), color(V+1,0);
2   function<void(int)> bfs = [&](int s) -> void {
3       queue<int> q;
4       bool bipartite = true;
5       q.push(s);
6       color[s] = 1;
7       cnt[1]++;

```

```

8  while( ! q.empty() ) {
9      int u = q.front();
10     q.pop();
11     for(int v : adj[u]) {
12         if( color[v] == 0 ) {
13             color[v] = 3 - color[u];
14             cnt[ color[v] ]++;
15             q.push(v);
16         }
17         else if( color[v] == color[u] )
18             bipartite = false;
19     }
20 }
21 if(!bipartite) {
22     cnt[1] = cnt[2] = 0;
23 }
24 };

```

Listing 31: Checking bipartiteness with BFS, count how many vertices were colored as 1 and 2, or set them to zero if the component is not bipartite.

5.6 *Negative Cycles

5.7 Topological Sort

```

1  vi topo;
2  vvi graph(V+1,vi());
3  vector<bool> visited(V+1,false);
4  function<void(int)> dfs = [&](int u) -> void {
5      visited[u] = true;

```

```

6      for(int v : graph[u])
7          if( ! visited[v] )
8              dfs(v);
9      topo.pb(u);
10 };
11 function<void()> topological_sort = [&]() -> void {
12     for(int i = 1; i <= V; i++)
13         if( ! visited[i] )
14             dfs(i);
15     reverse(all(topo));
16 };
17 topological_sort();
18 for(int i = 0; i < V; i++) cout << topo[i] << " ";

```

Listing 32: Recursive toposort implementation for unweighted DAG through vvi with DFS with inverted postorder. Runs in $O(|V| + |E|)$.

```

1  vi indegree(V+1,0);
2  vvi graph(V+1,vi());
3  vector<bool> visited(V+1,false);
4  fori(i,0,E) {
5      graph[u].pb(v);
6      indegree[v]++;
7  }
8  function<vi()> topological_sort = [&]() -> vi {
9      vi order, deg = indegree; // copy
10     queue<int> q;
11     for(int i = 1; i <= V; i++)
12         if( deg[i] == 0 )

```

```

13     q.push(i);
14     while( ! q.empty() ) {
15         int u = q.front(); q.pop();
16         order.pb(u);
17         for(int v : graph[u]) {
18             deg[v]--;
19             if(deg[v] == 0)
20                 q.push(v);
21         }
22     }
23     return order;
24 };
25 vi topo = topological_sort();
26 if( (int)(topo.size()) != V ) cout << "IMPOSSIBLE"
    << endl;

```

Listing 33: Kahn's Algorithm for Topological Sorting using BFS and indegree vertex analysis (nodes in a cycle will never have indegree zero). Works over unweighted directed graphs containing cycles through vvi. Runs in $O(|V| + |E|)$.

5.8 Disjoint Set Union (DSU)

```

1 class DisjointSets {
2 private:
3     vector<int> parents;
4 public:
5     vector<int> sizes;
6     DisjointSets(int size) : parents(size), sizes(size
    , 1) {

```

```

7         for (int i = 0; i < size; i++) { parents[i] = i;
8         }
9         /** @return the "representative" node in x's
10            component */
11         int find( int x ) {
12             return parents[x] == x ? x : ( parents[x] =
13                 find( parents[x] ) );
14         }
15         /** @return whether the merge changed connectivity
16            */
17         bool unite( int x, int y ) {
18             int x_root = find(x);
19             int y_root = find(y);
20             if (x_root == y_root) return false;
21             if ( sizes[x_root] < sizes[y_root] ) swap(x_root
22                 ,y_root);
23             sizes[x_root] += sizes[y_root];
24             parents[y_root] = x_root;
25             return true;
26         }
27         /** @return whether x and y are in the same
28            connected component */
29         bool connected( int x, int y ){
30             return find(x) == find(y);
31         }
32         void printLists() {
33             cout << "Printing parents..." << endl;

```

```

29     for(auto i : parents)
30         cout << i << " ";
31     cout << endl << "Printing sizes..." << endl;
32     for(auto i : sizes )
33         cout << i << " ";
34 }
35 };
36 DisjointSets dsu( V );
37 int number_of_components = V, largest_component = 1;
38 if( dsu.unite(x, y) ) {
39     largest_component = max( largest_component, dsu.
        sizes[ dsu.find( x ) ] );
40     number_of_components--;
41 }

```

Listing 34: Template and usage of DSU with path compression. Complexity of $O(m \alpha(n))$ for a sequence of m operations over n elements. Where α denotes Ackerman function, where $\alpha(n) \leq 4, \forall n \leq 10^{18}$. Practically $O(1)$.

5.9 Strongly Connected Components (SCC)

5.9.1 Kosaraju's Algorithm

```

1 vvi adj(V+1,vi()), condensed, components;
2 vector<bool> visited;
3 function<void(int,const vvi&,vi&)> dfs = [&](int u,
    vvi const& g, vi& output) -> void {
4     visited[u] = true;
5     for(int v : g[u])
6         if( ! visited[v] )

```

```

7         dfs(v,g,output);
8     output.push_back(u);
9 };
10 function<void()> kosaraju = [&]() -> void {
11     vvi adj_t(V+1);
12     vi order, roots(V+1,0);
13     visited.assign(V+1,false);
14     condensed.assign(V+1,vi());
15     for(int v = 1; v <= V; v++)
16         for(int u : adj[v])
17             adj_t[u].push_back(v);
18     for(int i = 1; i <= V; i++)
19         if( !visited[i] )
20             dfs(i,adj,order);
21     visited.assign(V+1,false);
22     reverse(order.begin(), order.end());
23     for(int v : order) {
24         if( !visited[v] ) {
25             vi component;
26             dfs(v,adj_t,component);
27             components.push_back(component);
28             int root = *component.begin();
29             for(int u : component)
30                 roots[u] = root;
31         }
32     }
33     for(int v = 1; v <= V; v++)
34         for(int u : adj[v])

```

```

35     if( roots[u] != roots[v] )
36         condensed[ roots[v] ].push_back( roots[u] );
37 };
38 kosaraju();

```

Listing 35: Template for implementing Kosaraju's and obtaining the condensed graph, and list of components for 1-indexed adjacency list. Runs in $O(|V| + |E|)$.

5.9.2 *Tarjan's Algorithm

5.10 2-SAT

```

1 struct TwoSatSolver {
2     int n_vars;
3     int n_vertices;
4     vector<vector<int>> adj, adj_t;
5     vector<bool> used;
6     vector<int> order, comp;
7     vector<bool> assignment;
8
9     TwoSatSolver(int _n_vars) : n_vars(_n_vars),
n_vertices(2 * n_vars), adj(n_vertices), adj_t(
n_vertices), used(n_vertices), order(), comp(
n_vertices, -1), assignment(n_vars) {
10         order.reserve(n_vertices);
11     }

73         solver.add_disjunction(0, false, 0, false);
74         //      a  v      a
75         assert(solver.solve_2SAT() == true);
76         auto expected = vector<bool>{true, false,
77         true};
78         assert(solver.assignment == expected);
79     }
80 };

```

Listing 36: 2-SAT implementation from cp-algorithms.com. Each component added is a expression of the form $a \vee b$, which is equivalent to $\neg a \Rightarrow b \wedge \neg b \Rightarrow a$ (if one of the variables is false, then the other one must be true). A directed graph is constructed based on these implication: For each x , there's two vertices v_x and $v_{\neg x}$. If there is an edge $a \Rightarrow b$, then there also is an edge $\neg b \Rightarrow \neg a$. For any x , if x is reachable from $\neg x$ and $\neg x$ is reachable from x , the problem has no solution. This means, each variable must be in a different SCC than their negative. This is verified by the method `solve_2SAT()`, which returns a boolean: `True` if it has a solution and `False` if it doesn't. Note: `example_usage()` uses `assert`; `bits/stdc++.h` does not guarantee it, so add `#include <cassert>` if you keep the example.

Giant Pizza How does a particular 2-SAT problem look like? Following is the statement for the problem CSES 1684 (Giant Pizza):

Uolevi's family is going to order a large pizza and eat it together. A total of n family members will join the order, and there are m possible toppings. The pizza may have any number of toppings. Each family member gives two wishes concerning the toppings of the pizza. The wishes are of the form "topping x is good/bad". Your task is to choose the toppings so that at least one wish from everybody becomes true (a good topping is included in the pizza or a bad topping is not included).

Input

The first input line has two integers n and m : the number of family members and toppings. The toppings are numbered $1, 2, \dots, m$. After this, there are n lines describing the wishes. Each line has two wishes of the form " $+x$ " (topping x is good) or " $-x$ " (topping x is bad).

Output

Print a line with m symbols: for each topping "+" if it is included and "-" if it is not included. You can print any valid solution. If there are no valid solutions, print "IMPOSSIBLE".

```

1  int main(){
2      fastIO();
3      int n = nxt(), m = nxt();
4      TwoSatSolver TwoSat(m);
5
6      for(i, 0, n){
7          char type1, type2;
8          int top1, top2;

5.11 *Bridges and point articulation

5.12 Flood Fill

```

1  vector<string> grid(n);
2  vii dirs = {{0,1},{0,-1},{1,0},{-1,0}};
3  ii start;
4  int arns = 0;
5  function<void(int,int)> traverse = [&](int i, int j)
6      -> void {
7      if( grid[i][j] == '#' ) return;
8      int newI, newJ;
9      if( grid[i][j] != '.' ) arns += grid[i][j] - '0';
10     grid[i][j] = '#';
```

```

10  for( ii move : dirs ) {
11      newI = i + move.fi; newJ = j + move.se;
12      if( newI >= 0 && newI < n && newJ >= 0 && newJ <
        m && grid[newI][newJ] == 'T' )
13          return;
14  }
15  for( ii move : dirs ) {
16      newI = i + move.fi; newJ = j + move.se;
17      if( newI >= 0 && newI < n && newJ >= 0 && newJ <
        m )
18          traverse(newI, newJ);
19  }
20 };
21 fori(i,0,n)
22     cin >> grid[i];
23 fori(i,0,n) {
24     fori(j,0,m) {
25         if( grid[i][j] == 'S' ) {
26             grid[i][j] = '.';
27             start.fi = i;
28             start.se = j;
29         }
30     }
31 }
32 traverse(start.fi, start.se);
33 cout << arns << endl;

```

Listing 38: Traverse a matrix of 'n' x 'm' on grid representation. The matrix is composed of '.' for a valid space (empty), '#' for a wall, 'T' for a trap, and a number for a treasure. This implementation takes the sum of every treasure in the maze. The condition for moving to the next location is that there are no Traps nearby (up, down, left, right), so the player will never be killed while traversing. It also implements a way to read numerous test cases, but without knowing beforehand how many there are. Runs in $O(n \cdot m)$. Originally used on the problem *Treasures* from 2024-2025 ICPC Bolivia Pre-National Contest.

178                 ans.emplace_back(edges[e].u, edges[e].v
);
179         }
180     }
181 }
182 return ans;
183 }
184 };

```

Listing 40: Commented template for solving MaxFlow problems with Dinic's algorithm. Works in complexity $O(|V|^2 \times |E|)$. In bipartite graphs and graphs with unitary max capacity the complexity turns $O(|E| \times \sqrt{|V|})$.

Download Speed How does a particular flow problem looks like? Following is the statement for the problem CSES 1694 (Download Speed):

Consider a network consisting of n computers and m connections. Each connection specifies how fast a computer can send data to another computer.

Kotivalo wants to download some data from a server. What is the maximum speed he can do this, using the connections in the network?

Input

The first input line has two integers n and m : the number of computers and connections. The computers are numbered $1, 2, \dots, n$. Computer 1 is the server and computer n is Kotivalo's computer.

After this, there are m lines describing the connections. Each line has three integers a, b , and c : computer a can send data to computer b at speed c .

Output

Print one integer: the maximum speed Kotivalo can download data.

```

1 int main() {
2     fastIO();
3     int n, m, u, v, w;
4     cin >> n >> m;
5     Dinic flow(n+1,1,n); // size n+1 to fix 0-
indexed indexes, 1 is the source (server), 'n' is
the sink (Kotivalo)
6     fori(i,0,m) {
7         cin >> u >> v >> w;

```

```

8         flow.addEdge(u,v,w);
9     }
10    cout << flow.maxFlow() << endl;
11    return 0;
12 }

```

Listing 41: Main method for solving CSES 1697 Download Speed using MaxFlow template.

Police Chase Max Flow-Min Cut Theorem: $\text{MaxFlow} = \text{MinCut}$.

Following is the statement for the problem CSES 1695 (Police Chase):

Kaaleppi has just robbed a bank and is now heading to the harbor. However, the police wants to stop him by closing some streets of the city.

What is the minimum number of streets that should be closed so that there is no route between the bank and the harbor?

Input

The first input line has two integers n and m : the number of crossings and streets. The crossings are numbered $1, 2, \dots, n$. The bank is located at crossing 1, and the harbor is located at crossing n .

After this, there are m lines that describing the streets. Each line has two integers a and b : there is a street between crossings a and b . All streets are two-way streets, and there is at most one street between two crossings.

Output

First print an integer k : the minimum number of streets that should be closed. After this, print k lines describing the streets. You can print any valid solution.

```

1 int main() {
2     fastIO();
3     int n, m, u, v;
4     vii minCut;

```

```

5     cin >> n >> m;
6     Dinic flow(n+1,1,n); // size n+1 to fix 0-
    indexed indexes, 1 is the source (bank), 'n' is
    the sink (harbor)
7     fori(i,0,m) {
8         cin >> u >> v;
9         flow.addEdge(u,v,1);
10        flow.addEdge(v,u,1);
11    }
12    flow.maxFlow();
13    minCut = flow.minCut();
14    cout << (sz(minCut)/2) << endl;
15    for(int i = 0; i < sz(minCut); i += 2)
16        cout << minCut[i].fi << " " << minCut[i].se
    << endl;
17    return 0;
18 }

```

Listing 42: Main method for solving CSES 1695 Police Chase using MaxFlow template.

School Dance MaxFlow = MinCut = MaxMatching.

Following is the statement for the problem CSES 1696 (School Dance):

There are n boys and m girls in a school. Next week a school dance will be organized. A dance pair consists of a boy and a girl, and there are k potential pairs.

Your task is to find out the maximum number of dance pairs and show how this number can be achieved.

Input

The first input line has three integers n , m and k : the number of boys, girls, and potential pairs. The boys are numbered $1, 2, \dots, n$, and the girls are numbered $1, 2, \dots, m$.

After this, there are k lines describing the potential pairs. Each line has two integers a and b : boy a and girl b are willing to dance together.

Output

First print one integer r : the maximum number of dance pairs. After this, print r lines describing the pairs. You can print any valid solution.

```

1 int main() {
2     fastIO();
3     int n, m, k, a, b;
4     ll maxPairs;
5     vii pairs;
6     cin >> n >> m >> k;
7     Dinic flow(n+m+2, 0, n+m+1);
8     fori(boy, 0, n+1)
9         flow.addEdge(0, boy, 1);
10    fori(girl, n+1, n+m+1)
11        flow.addEdge(girl, n+m+1, 1);
12    fori(i, 0, k) {
13        cin >> a >> b;
14        flow.addEdge(a, n+b, 1);
15    }
16    maxPairs = flow.maxFlow();
17    pairs = flow.maximumMatching();
18    cout << maxPairs << endl;
19    fori(i, 0, sz(pairs))
20        cout << pairs[i].fi << " " << (pairs[i].se -

```

```

    n) << endl;;
21    return 0;

10            mxDepth1 = depth;
11        }
12        else if( depth > mxDepth2 )
13            mxDepth2 = depth;
14    }
15    if( mxDepth1 != -1 and mxDepth2 != -1 )
16        diameter = max(diameter,mxDepth1 + mxDepth2 + 2)
17        ;
18    if( mxDepth1 != -1 )
19        diameter = max(diameter, mxDepth1 + 1);
20    return mxDepth1 + 1;
};
```

```
21 dfs(1,0);
```

Listing 45: Calculates the length of Tree Diameter using a DP approach. Runs in $O(|V|)$.

```
1 vector<vector<int>> adj(V+1,vector<int>());
2 int diameter = 0, farthest = 1;
3 function<void(int,int,int)> dfs = [&](int u, int p,
    int dist) -> void {
4     if( dist > diameter ) {
5         farthest = u;
6         diameter = dist;
7     }
8     for( int v : adj[u] ) {
9         if( v == p ) continue;
10        dfs(v,u,dist+1);
11    }
12 };
13 dfs(1,0,0);
14 diameter = 0;
15 dfs(farthest,0,0);
```

Listing 46: Calculates the length of Tree Diameter using the double DFS mehtod. Runs in $O(|V|)$.

6.3 *Centroid Decomposition

6.4 Euler Tour

```
1 int timer = 0;
```

```

2 // Queries on subtree range [in,out)
3 function<void(int,int)> euler_tour = [&](int u, int
    p) -> void {
4     in[u] = timer++;
5     for(int v : adj[u])
6         if( v != p )
7             euler_tour(v,u);
8     out[u] = timer;
9 };
10 euler_tour(1,0);
11 //==== Queries with Fenwick Tree
12 BIT<ll> bit(V);
13 for(int u = 1; u <= V; u++) bit.update(in[u]+1,v[u])
    ;
14 // Update 'node' to 'val' (set operation)
15 bit.update(in[node]+1,val-v[node]);
16 v[node] = val;
17 // Query (ET is 0-idx, but BIT 1-idx)
18 cout << bit.query(in[node]+1,out[node]) << endl;
19 //==== Queries with Segment Tree
20 vll flat(V+1);
21 for(int i = 1; i <= V; i++)
22     flat[ in[i] ] = v[i];
23 Segment_tree st(V);
24 st.build(flat,1,0,V-1);
25 st.update(1,in[node],0,V-1,val);
26 st.query(1,in[node],out[node]-1,0,V-1);

```

Listing 47: Euler Tour implementation, runs in $O(|V| + |E|)$. Works with an 1-indexed logic, but the time mapping is 0-indexed. Brings necessary logic to work with BIT and ST templates.

9 Mathematics

9.1 Number Theory

9.1.1 Greatest Common Divisor (GCD)

```

1 ll gcd(ll a, ll b) {
2     while (b != 0) {
3         ll r = a % b;
4         a = b;
5         b = r;
6     }
7     return a;
8 }

```

Listing 50: Implementation of handmade GCD, because using `gcd()` runs slow with long long, also `__gcd()`.

9.1.2 Gauss Sum

The sum of the first n natural numbers in $O(1)$.

$$S = \frac{n(n+1)}{2} \quad (1)$$

$$n = \sqrt{2S + \frac{1}{4}} - \frac{1}{2} \quad (2)$$

```

1 int S = (1LL * n * (1LL * n + 1LL))/2;
2 int n = (int)( sqrt( 2 * S + 0.25 ) - 0.5 )

```

Listing 51: Implementation of the Gauss Sum.

9.1.3 Fermat's Little Theorem

$$a^{-1} \equiv 1 \pmod{p} \quad \forall p \text{ primo, } (a, p) = 1$$

$$a^{p-2} \cdot a = 1$$

$$\Rightarrow a^{-1} \equiv a^{p-2} \pmod{p}$$

9.1.4 Bnpow

```

1 const int MOD = 1e9+7;
2 int bnpow( long long a, long long b ) { // a^b
3     long long sol = 1;
4     a %= MOD;
5     while( b > 0 ) {
6         if( b & 1 )
7             sol = ( 1LL * sol * a ) % MOD;
8         a = ( 1LL * a * a ) % MOD;
9         b >>= 1;
10    }
11    return sol % MOD;
12 }

```

Listing 52: Applying binary exponentiation to a problem requiring $a^b \bmod (10^9 + 7)$ in $O(\log_2(b))$.

9.1.5 Modulo Inverse

```

1 const int MOD = 1e9+7;
2 int bnpow( long long a, long long b ); // defined
   in bnpow.cpp
3
4 int inv(int a) {
5     return bnpow(a, MOD-2);
6 }

```

Listing 53: Computes $a^{-1}(m)$ in $O(\log(MOD))$. Requires the bnpow implementation from the Bnpow section.

9.1.6 *Chinese Remainder Theorem

9.1.7 Prime checking

```

1 bool prime( int n ){
2     if( n == 2 )
3         return true;
4     if( n % 2 == 0 || n <= 1 )
5         return false;
6     for( long long i = 3; i * i <= n; i += 2 )
7         if( ( n % i ) == 0 )
8             return false;
9     return true;
10 }

```

Listing 54: Returns if n is a prime number in $O(\sqrt{n})$. Avoids overflow $\forall n \leq 10^6$ ($\approx INT_MAX$).

9.1.8 Prime factorization

```

1 void prime_factorization(vll& factorization, ll n) {
2     for(long long d = 2; d*d <= n; d++) {
3         while(n % d == 0) {
4             factorization.push_back(d);
5             n /= d;
6         }
7     }
8     if( n > 1 )
9         factorization.push_back(n);
10 }

```

Listing 55: Returns prime factorization of the number n using *trial division*, simplest way. Runs in $O(\sqrt{n})$. e.g. for 12 the result is 2x2x3.

9.1.9 Sieve of Eratosthenes

```

1 void sieve_of_eratosthenes(vector<bool>& is_prime,
2     int n) {
3     is_prime.assign(n+1,true);
4     is_prime[0] = is_prime[1] = false;
5     for(int i = 2; i <= n; i++) {
6         if( is_prime[i] && (long long)i * i <= n ) {
7             for(int j = i*i; j <= n; j += i)
8                 is_prime[j] = false;
9         }
10 }

```

Listing 56: Calculates every prime number up to n with sieve of eratosthenes in a boolean 1-indexed vector. Runs in $O(n \log \log n)$.

9.1.10 Sum of Divisors

```

1 ll sum_of_divisors(ll n) {
2     ll sum = 1;
3     for (ll i = 2; i * i <= n; i++) {
4         if(n % i == 0) {
5             int e = 0;
6             do {
7                 e++;
8                 n /= i;
9             } while (n % i == 0);
10            ll s = 0, pow = 1;
11            do {
12                s += pow;
13                pow *= i;
14            } while (e-- > 0);
15            sum *= s;
16        }
17    }
18    if(n > 1)
19        sum *= (1 + n);
20    return sum;
21 }

```

Listing 57: Calculates the sum of all divisors of number n . e.g. $sum_of_divisors(12) = 18$. Runs in $O(\sqrt{n})$.

```

1 void sum_of_divisors_sieve( vll& sigma, int n ) {
2     sigma.assign(n+1,0);
3     for(int i = 1; i <= n; i++)
4         for(int j = i; j <= n; j+=i)
5             sigma[j] += i;
6 }
```

Listing 58: Calculates the sum of all divisors of all numbers from 1 to n . Runs in $O(n \log(n))$.

9.2 Combinatorics

9.2.1 Binomial Coefficients

```

1 const int MAXN = 1e6+1;
2 vll fact(MAXN+1), inv(MAXN+1);
3 int binpow( ll a, ll b ); // defined in binpow.cpp
4
5 void combi() {
6     fact[0] = inv[0] = 1;
7     fori(i,1,MAXN+1) {
8         fact[i] = fact[i-1] * i % MOD;
9         inv[i] = binpow( fact[i], MOD - 2 );
10    }
11 }
12 ll nCr( ll n, ll r ) {
```

```

13     return fact[n] * inv[r] % MOD * inv[n-r] % MOD;
14 }
15 combi();
16 nCr(a,b);
```

Listing 59: Template for calculating binomial coefficients $\binom{n}{k} = \frac{n!}{k!(n-k)!}$. Precalculate $fact$ and inv runs in $O(MAXN \cdot \log_2(MOD))$ ($\log_2(MOD) \approx 30$). So, in general case when $NMAX = 10^6$ and $MOD = 10^9 + 7$ can be generalized to $O(n \cdot \log(n))$, $n \leq 10^6$. Requires the binpow implementation from the Binpow section.

9.2.2 Common combinatorics formulas

$$\binom{n}{2} = \frac{n(n-1)}{2} \quad (3)$$

$$\sum_{k=0}^n \binom{n}{k} = 2^n \quad (4)$$

$$\sum_{k=0}^n \binom{n}{k} \binom{n}{n-k} = \binom{2n}{n} \quad (5)$$

$$\sum_{k=0}^n k \binom{n}{k} = n2^{n-1} \quad (6)$$

$$\sum_{k=0}^{\infty} \binom{2k}{k} \binom{2n-2k}{n-k} = 4^n \quad (7)$$

9.2.3 Stars and Bars

The number of ways to accommodate a binary string made of n and k elements. The number of ways I have to accommodate n equal balls into k bags.

$$\binom{n+k-1}{k-1} = \binom{n+k-1}{n}$$

9.3 Probability

9.3.1 Laplace's Rule

$$P(A) = \frac{\text{Favorable cases}}{\text{Total possible cases}}$$

Discrete probability of an event A where all cases are equally probable.

9.3.2 Probability Distributions

Geometric Distribution

$$P(X = k) = (1 - p)^{k-1}p$$

p = Probability of a single success.

"La probabilidad de que X sea exactamente igual a k es $1 -$ la probabilidad de un éxito a la potencia de la cantidad de fracasos por la probabilidad del éxito".

Models the probability of having exactly $k - 1$ failures before a success in the k 'th try.

Binomial Distribution

$$P(X = k) = \binom{n}{k} p^k (1 - p)^{n-k}$$

p = Probability of a single success.

k = Number of total successes we are looking for.

n = Total number of tries.

"La probabilidad de que ocurran k éxitos en n intentos es de la binomial de número de intentos sobre la cantidad de éxitos buscados, por la probabilidad de un éxito a la potencia de los éxitos buscados por $1 -$ la probabilidad de los éxitos buscados a la potencia de la diferencia entre la cantidad de intentos y de éxitos".

Models the probability of having exactly k successes in n total tries (no matter the order). We're looking for k successes and $n - k$ failures.

9.3.3 Expected Value

Expected Value is the average of all possible results. Use when asked for "the expected number of tries".

Discrete Random Variable X :

$$E[X] = \sum_{i=1}^n x_i P(x_i)$$

Continuous Random Variable X :

$$E[X] = \int_{-\infty}^{\infty} x f(x) dx$$

Properties of Expected Value

Property	Formula
Linearity (always)	$E[X + Y] = E[X] + E[Y]$
Constant	$E[c] = c$
Multiplication	$E[cX] = cE[X]$
Product (if indep.)	$E[XY] = E[X]E[Y]$
Non-Negativity	$X \geq 0 \implies E[X] \geq 0$
Monotonicity	$X \leq Y \implies E[X] \leq E[Y]$
Total Exp. (partitions)	$E[X] = \sum_y E[X Y = y]P(Y = y)$
Variance	$Var(X) = E[X^2] - (E[X])^2$

9.4 Computational Geometry

9.4.1 Point Struct

```

1 struct pt{
2     ll x, y;
3     pt(){}
4     pt(ll _x, ll _y) : x(_x), y(_y){}
5     pt operator +(const pt &p) const { return pt(x+p
6     .x, y+p.y);}
7     pt operator -(const pt &p) const { return pt(x-p
8     .x, y-p.y);}
9     bool operator ==(pt const &t) const {
10         return x == t.x && y == t.y;
11     }
12     bool operator < (pt const &p) const { return x <
13     p.x || (x == p.x && y < p.y); }
```

```

11     ll cross(const pt & p) const { return x*p.y - y*
    p.x;}
12     ll dot(const pt &p) const { return x*p.x + y*p.y
    ;}
13     ll norm() const {return this-> dot(*this);}
14 };

```

Listing 60: Template for the **Point** structure (or 2D vector) with its addition, subtraction, dot product, cross product and squared norm.

9.4.2 Polygon Area

```

1 double polygon_area(const vector<pt>& p){
2     ll area = 0;
3     int n = p.size();
4     for(i,0,n){
5         area += p[i].cross(p[(i+1) % n]);
6     }
7     return abs((double)area)/2;
8 }

```

Listing 61: Obtains the area of a polygon formed by a set of Points (2D) stored in a `std::vector` with a time complexity of $O(n)$. It returns a double, since it has a division by 2, but it can return a ll for double the area. Requires the `pt` struct seen in the previous listing.

9.4.3 Convex Hull

```

1 ll orientation(pt a, pt b, pt c) {
2     return (b - a).cross(c - a);

```

```

3 }
4
5 bool cw(pt a, pt b, pt c, bool include_collinear) {
6     ll o = orientation(a, b, c);
7     return o < 0 || (include_collinear && o == 0);
8 }
9
10 bool ccw(pt a, pt b, pt c, bool include_collinear) {
11     ll o = orientation(a, b, c);
12     return o > 0 || (include_collinear && o == 0);
13 }
14
15 void convex_hull(vector<pt>& a, bool
    include_collinear = false) {
16     if (a.size() == 1)
17         return;
18
19     sort(a.begin(), a.end());
20     pt p1 = a[0], p2 = a.back();
21     vector<pt> up, down;
22     up.push_back(p1);
23     down.push_back(p1);
24     for (int i = 1; i < (int)a.size(); i++) {
25         if (i == a.size() - 1 || cw(p1, a[i], p2,
            include_collinear)) {
26             while (up.size() >= 2 && !cw(up[up.size()
                -2], up[up.size()-1], a[i], include_collinear))
27                 up.pop_back();
                up.push_back(a[i]);

```

```

28     }
29     if (i == a.size() - 1 || ccw(p1, a[i], p2,
include_collinear)) {
30         while (down.size() >= 2 && !ccw(down[
down.size()-2], down[down.size()-1], a[i],
include_collinear))
31             down.pop_back();
32         down.push_back(a[i]);
33     }
34 }
35
36 if (include_collinear && up.size() == a.size())
37 {
38     reverse(a.begin(), a.end());
39     return;
40 }
41 a.clear();
42 for (int i = 0; i < (int)up.size(); i++)
43     a.push_back(up[i]);
44 for (int i = down.size() - 2; i > 0; i--)
45     a.push_back(down[i]);
46 }

```

Listing 62: Computes the convex hull of a point set with the Monotone Chain (Andrew's algorithm) in $O(n \log n)$. Mutates the input vector and returns the hull in clockwise order; `include_collinear` keeps collinear points that lie on hull edges. Requires the `pt` struct.

9.4.4 Convexity Check

```

1 // o = orientation of the turn p[i] -> p[i+1] -> p[i
+2]:
2 // > 0 counter-clockwise, < 0 clockwise, == 0
collinear.
3 bool is_convex(const vector<pt>& p, bool
allow_collinear = true) {
4     int n = sz(p);
5     if (n <= 2) return true;
6     int sgn = 0;
7     for (i = 0, n) {
8         int o = (p[(i+1)%n] - p[i]).cross(p[(i+2)%n]
- p[i]);
9         if (o == 0) {
10             if (!allow_collinear) return false;
11             continue;
12         }
13         if (sgn == 0) sgn = (o > 0 ? 1 : -1);
14         else if (o * sgn < 0) return false;
15     }
16     return true;
17 }

```

Listing 63: Checks whether a polygon given in clockwise or counter-clockwise order is convex in $O(n)$. With `allow_collinear` it also accepts collinear consecutive vertices (non-strict convexity). Requires the `pt` struct.

9.5 Linear Algebra

9.5.1 XOR Basis

```

1  template<typename T = int, int B = 31>
2  struct Basis {
3      T basis[B];
4      int bsz = 0;
5      void clear() {
6          memset(basis, 0, sizeof basis);
7          bsz = 0;
8      }
9      Basis() {
10         clear();
11     }
12     bool insert(T x) {
13         for(int bit = B-1; bit >= 0; bit--) {
14             if( x & (1 << bit) ) {
15                 if( basis[bit] )
16                     x ^= basis[bit];
17                 else {
18                     basis[bit] = x;
19                     bsz++;
20                     return true;
21                 }
22             }
23         }
24         return false;
25     }

```

```

26     T max() {
27         int mx = 0;
28         for(int bit = B-1; bit >= 0; bit--)
29             mx = std::max(mx, mx ^ basis[bit]);
30         return mx;
31     }
32     bool can(T x) {
33         for(int bit = B-1; bit >= 0; bit--)
34             x = min(x, x ^ basis[bit]);
35         return x == 0;
36     }
37     bool merge(Basis& b) {
38         bool f = false;
39         for(int bit = B-1; bit >= 0; bit--)
40             if( b.basis[bit] and ! insert(b.basis[bit]) )
41                 f = true;
42         return f;
43     }
44     T kth(int k) {
45         T x = 0;
46         T cnt = ((T)1 << bsz);
47         for(int i = B-1; i >= 0; i--) {
48             if(! basis[i] )
49                 continue;
50             if( k > (cnt >> 1) ) {
51                 if( ! (x >> i & 1) )
52                     x ^= basis[i];
53                 k -= cnt >> 1;

```

```

54     }
55     else
56         if( x >> i & 1 )
57             x ^= basis[i];
58         cnt >= 1;
59     }
60     return x;
61 }
62 };

```

Listing 64: Template for implementing XOR Basis and its operations: insert, max number doable, can do a certain number with that basis, merge two basis and find the k-th number doable.

9.5.2 Matrix Exponentiation (Linear Recurrency)

```

1  template <typename T> void matmul(vector<vector<T>>
    &a, const vector<vector<T>>& b) {
2      size_t n = a.size(), m = a[0].size(), p = b[0].
        size();
3      assert(m == b.size());
4      vector<vector<T>> c(n, vector<T>(p));
5      for(size_t i = 0; i < n; i++)
6          for(size_t j = 0; j < p; j++)
7              for(size_t k = 0; k < m; k++)
8                  c[i][j] = (c[i][j] + a[i][k] * b[k][j])
                            % MOD;
9      a = c;
10 }

```

```

11 template <typename T> struct Matrix {
12     vector<vector<T>> mat;
13     Matrix() {}
14     Matrix(vector<vector<T>> a) { mat = a; }
15     Matrix(int n, int m) {
16         mat.resize(n);
17         for(int i = 0; i < n; i++) {mat[i].resize(m);
18     }
19     int rows() const { return mat.size(); }
20     int cols() const { return mat[0].size(); }
21     void makeIden() {
22         for(int i = 0; i < rows(); i++)
23             for(int j = 0; j < cols(); j++)
24                 mat[i][j] = (i == j ? 1 : 0);
25     }
26     Matrix operator*=(const Matrix &b) {
27         matmul(mat, b.mat);
28         return *this;
29     }
30     void print() {
31         for(int i = 0; i < rows(); i++) {
32             for(int j = 0; j < cols(); j++)
33                 cout << mat[i][j] << " ";
34             cout << endl;
35         }
36     }

```

```

37   Matrix operator*(const Matrix &b) { return Matrix
    (*this) *= b; }
38 };
39 int main() {
40     Matrix<ll> A( {{1,1},{1,0}} );
41     Matrix<ll> ini(2,1);
42     ini.mat[0][0] = 0;
43     ini.mat[1][0] = 1;
44     Matrix<ll> iden(2,2);
45     iden.makeIden();
46     ll n;
47     cin >> n;
48     while(n > 0) {
49         if( n & 1 ) iden *= A;
50         A *= A;
51         n >>= 1;
52     }
53     Matrix<ll> res = iden * ini;
54     cout << res.mat[0][0] << endl;
55     return 0;
56 }

```

Listing 65: Template to pow a matrix of size n to a certain exponent with logarithmic time (using binpow), and multiply it to another matrix, with modulo operation, as well as how to use it. Full implementation for calculating n -th Fibonacci term with linear recurrency.

9.5.3 *Fast Fourier Transform (FFT)

10 Appendix

10.1 What to do against WA?

1. Have you done the correct complexity analysis?
2. Have you understood well the statement?
3. Have you corroborated yet the trivial test cases?
4. Have you checked all the corner cases?
5. Have you proposed a lot of non-trivial test cases?
6. Isn't there any possibility of overflow? (Multiplying two `int` needs to be fitted into a `long long`)
7. Have you done a desktop test?
8. Have you read all the variables? (`tc` variable on `main`)
9. Every part of your code works as it's meant to?

10.2 Primitive sizes

Data type	[B]	Minimum value it takes	Maximum value it takes
bool	1	0	1
signed char	1	-128	127
unsigned char	1	0	255
signed int	4	$-2,147,483,648 \approx -2 \times 10^9$	$2,147,483,647 \approx 2 \times 10^9$
unsigned int	4	0	$4,294,967,295 \approx 4 \times 10^9$

10.5 How a `vector<vector<pair<int,int>>>` looks like

Figure 1: Visual representation of a vector of vector of pairs.

10.6 How all neighbours of a grid looks like

Figure 2: Visual representation of how all adjacent cells in a grid looks like.

10.7 Motivation
